# 1 Introduction

## Abstract

SPIR-V is a simple binary intermediate language for graphical shaders and compute kernels. A SPIR-V module contains multiple entry points with potentially shared functions in the entry point's call trees. Each function contains a control-flow graph (CFG) of basic blocks, with optional instructions to express structured control flow. Load/store instructions are used to access declared variables, which includes all input/output (IO). Intermediate results bypassing load/store use static single-assignment (SSA) representation. Data objects are represented logically, with hierarchical type information: There is no flattening of aggregates or assignment to physical register banks, etc. Selectable addressing models establish whether general pointer operations may be used, or if memory access is purely logical.

This document fully defines **SPIR-V**, a Khronos-standard binary intermediate language for representing graphical-shader stages and compute kernels for multiple client APIs.

This is a [unified specification](#), specifying all versions since and including version 1.0.

## 1.1 Goals

SPIR-V has the following goals:

- Provide a simple binary intermediate language for all functionality appearing in Khronos shaders/kernels.
- Have a concise, transparent, self-contained specification (sections [Specification](#) and [Binary Form](#)).
- Map easily to other intermediate languages.
- Be the form passed by a client API into a driver to set shaders/kernels.
- Support multiple execution environments, specified by client APIs.
- Can be targeted by new front ends for novel high-level languages.
- Allow the first steps of compilation and reflection to be done offline.
- Be low-level enough to require a reverse-engineering step to reconstruct source code.
- Improve portability by enabling shared tools to generate or operate on it.
- Reduce compile time during application run time. (Eliminating most of the compile time during application run time is not a goal of this intermediate language. Target-specific register allocation and scheduling are still expected to take significant time.)
- Allow some optimizations to be done offline.

## 1.2 Execution Environment and Client API

SPIR-V is adaptable to multiple execution environments: A SPIR-V module is consumed by an execution environment, as specified by a client API. The full set of rules needed to consume SPIR-V in a particular environment comes from the combination of SPIR-V and that environment's client API specification. The client API will specify its SPIR-V execution environment as well as extra rules, limitations, capabilities, etc. required by the form of SPIR-V it can validly consume.

### 1.3 About this document

This document aims to:

- Include everything needed to fully understand, create, and consume SPIR-V. However:
  - Extended instruction sets can be imported and come with their own specifications.
  - Client API-specific rules are documented in client API specifications.
- Separate expository and specification language. The specification-proper is in [Specification](#) and [Binary Form](#).

### 1.4 Extendability

SPIR-V can be extended by multiple vendors or parties simultaneously:

- Using the [OpExtension](#) instruction to require new semantics that must be supported. Such new semantics would come from an extension specification.
- Reserving (registering) ranges of the token values, as described further below.
- Aided by instruction skipping, also further described below.

**Enumeration Token Values.** It is easy to extend all the types, storage classes, opcodes, decorations, etc. by adding to the token values.

**Registration.** Ranges of token values in the [Binary Form](#) section can be pre-allocated to numerous vendors/parties. This allows combining multiple independent extensions without conflict. To register ranges, use the <https://github.com/KhronosGroup/SPIRV-Headers> repository, and submit pull requests against the `include/spirv/spir-v.xml` file.

**Extended Instructions.** Sets of extended instructions can be provided and specified in separate specifications. Multiple sets of extended instructions can be imported without conflict, as the extended instructions are selected by {set id, instruction number} pairs.

**Instruction Skipping.** Tools are encouraged to skip opcodes for features they are not required to process. This is trivially enabled by the [word count](#) in an instruction, which makes it easier to add new instructions without breaking existing tools.

### 1.5 Debuggability

SPIR-V can decorate, with a text string, virtually anything created in the shader: types, variables, functions, etc. This is required for externally visible symbols, and also allowed for naming the result of any instruction. This can be used to aid in understandability when disassembling or debugging lowered versions of SPIR-V.

Location information (file names, lines, and columns) can be interleaved with the instruction stream to track the origin of each instruction.

### 1.6 Design Principles

**Regularity.** All instructions start with a word count. This allows walking a SPIR-V module without decoding each opcode. All instructions have an opcode that dictates for all operands what kind of operand they are. For instructions with a variable number of operands, the number of variable operands is known by subtracting the number of non-variable words from the instruction's word count.

**Non Combinatorial.** There is no combinatorial type explosion or need for large encode/decode tables for types. Rather, types are parameterized. Image types declare their dimensionality, arrayness, etc. all orthogonally, which greatly simplify

code. This is done similarly for other types. It also applies to opcodes. Operations are orthogonal to scalar/vector size, but not to integer vs. floating-point differences.

**Modeless.** After a given execution model (e.g., pipeline stage) is specified, internal operation is essentially modeless: Generally, it will follow the rule: "same spelling, same semantics", and does not have mode bits that modify semantics. If a change to SPIR-V modifies semantics, it should use a different spelling. This makes consumers of SPIR-V much more robust. There are execution modes declared, but these generally affect the way the module interacts with its execution environment, not its internal semantics. Capabilities are also declared, but this is to declare the subset of functionality that is used, not to change any semantics of what is used.

**Declarative.** SPIR-V declares externally-visible modes like "writes depth", rather than having rules that require deduction from full shader inspection. It also explicitly declares what addressing modes, execution model, extended instruction sets, etc. will be used. See [Language Capabilities](#) for more information.

**SSA.** All results of intermediate operations are strictly SSA. However, declared variables reside in memory and use load/store for access, and such variables can be stored to multiple times.

**IO.** Some storage classes are for input/output (IO) and, fundamentally, IO will be done through load/store of variables declared in these storage classes.

## 1.7 Static Single Assignment (SSA)

SPIR-V includes a phi instruction to allow the merging together of intermediate results from split control flow. This allows split control flow without load/store to memory. SPIR-V is flexible in the degree to which load/store is used; it is possible to use control flow with no phi-instructions, while still staying in SSA form, by using memory load/store.

Some storage classes are for IO and, fundamentally, IO will be done through load/store, and initial load and final store can never be eliminated. Other storage classes are shader local and can have their load/store eliminated. It can be considered an optimization to largely eliminate such loads/stores by moving them into intermediate results in SSA form.

## 1.8 Built-In Variables

SPIR-V identifies built-in variables from a high-level language with an enumerant decoration. This assigns any unusual semantics to the variable. Built-in variables must otherwise be declared with their correct SPIR-V type and treated the same as any other variable.

## 1.9 Specialization

*Specialization* enables offline creation of a portable SPIR-V module based on constant values that won't be known until a later point in time. For example, to size a fixed array with a constant not known during creation of a module, but known when the module will be lowered to the target architecture.

See [Specialization](#) in the next section for more details.

## 1.10 Example

The SPIR-V form is binary, not human readable, and fully described in [Binary Form](#). This is an example disassembly to give a basic idea of what SPIR-V looks like:

GLSL fragment shader:

```
#version 450

in vec4 color1;
in vec4 multiplier;
noperspective in vec4 color2;
out vec4 color;

struct S {
    bool b;
    vec4 v[5];
    int i;
};

uniform blockName {
    S s;
    bool cond;
};

void main()
{
    vec4 scale = vec4(1.0, 1.0, 2.0, 1.0);

    if (cond)
        color = color1 + s.v[2];
    else
        color = sqrt(color2) * scale;

    for (int i = 0; i < 4; ++i)
        color *= multiplier;
}
```

Corresponding SPIR-V:

```

## 2 Specification

### 2.1 Language Capabilities

A SPIR-V module is consumed by a client API that needs to support the features used by that SPIR-V module. Features are classified through [capabilities](#). Capabilities used by a particular SPIR-V module must be declared early in that module with the [OpCapability](#) instruction. Then:

- A validator can validate that the module uses only its declared capabilities.
- A client API is allowed to reject modules declaring capabilities it does not support.

All available capabilities and their dependencies form a capability hierarchy, fully listed in the capability section. Only top-level capabilities need to be explicitly declared; their dependencies are implicitly declared.

When an instruction, enumerant, or other feature specifies multiple enabling capabilities, only one such capability needs to be declared to use the feature. This declaration does not itself imply anything about the presence of the other enabling capabilities: The execution environment needs to support only the declared capability.

The SPIR-V specification provides universal capability-specific validation rules, in the [validation section](#). Additionally, each client API must include the following:

- Which capabilities in the [capability](#) section it supports or requires, and hence allows in a SPIR-V module.
- Any additional validation rules it has beyond those specified by the SPIR-V specification.
- Required limits, if they are beyond the [Universal Limits](#).

### 2.2 Terms

#### 2.2.1 Instructions

*Word:* 32 bits.

*<id>:* A numerical name; the name used to refer to an object, a type, a function, a label, etc. An *<id>* always consumes one [word](#). The *<id>s* defined by a module obey [SSA](#).

*Result <id>:* Most instructions define a result, named by an *<id>* explicitly provided in the instruction. The *Result <id>* is used as an operand in other instructions to refer to the instruction that defined it.

*Literal:* An immediate value, not an *<id>*. Literals larger than one [word](#) will consume multiple operands, one per word. An instruction will state what type the literal will be interpreted as. A string is interpreted as a nul-terminated stream of characters. The character set is Unicode in the UTF-8 encoding scheme. The UTF-8 octets (8-bit bytes) are packed four per [word](#), following the little-endian convention (i.e., the first octet is in the lowest-order 8 bits of the word). The final word contains the string's nul-termination character (0), and all contents past the end of the string in the final word are padded with 0. For a numeric literal, the lower-order words appear first. When a numeric type's bit width is less than 32-bits, the value appears in the low-order bits of the word, and the high-order bits must be 0 for a [floating-point type](#) or [integer type](#) with *Signedness* of 0, or sign extended for an integer type with a *Signedness* of 1 (similarly for the remaining bits of widths larger than 32 bits but not a multiple of 32 bits).

*Operand:* A one-[word](#) argument to an instruction. E.g., it could be an *<id>*, or (or part of) a [literal](#). Which form it holds is always explicitly known from the opcode.

*WordCount:* The complete number of [words](#) taken by an instruction, including the word holding the word count and opcode, and any optional operands. An instruction's word count is the total space taken by the instruction.

*Instruction:* After a header, a module is simply a linear list of instructions. An instruction contains a [word count](#), an opcode, an optional [Result <id>](#), an optional *<id>* of the instruction's type, and a variable list of operands. All instruction opcodes and semantics are listed in [Instructions](#).

*Decoration:* Auxiliary information such as built-in variable, stream numbers, invariance, interpolation type, relaxed precision, etc., added to [<id>s](#) or structure-type members through [Decorations](#). Decorations are enumerated in Decoration in the [Binary Form](#) section.

*Object:* An instantiation of a non-void type, either as the [Result <id>](#) of an operation, or created through [OpVariable](#).

*Memory Object:* An object created through [OpVariable](#). Such an object can die on function exit, if it was a function variable, or exist for the duration of an entry point.

*Memory Object Declaration:* An [OpVariable](#), or an [OpFunctionParameter](#) of pointer type, or the contents of an [OpVariable](#) that holds either a pointer to the [PhysicalStorageBuffer storage class](#) or an array of such pointers.

*Intermediate Object or Intermediate Value or Intermediate Result:* An object created by an operation (not memory allocated by [OpVariable](#)) and dying on its last consumption.

*Constant Instruction:* Either a specialization-constant instruction or a fixed constant instruction: Instructions that start "OpConstant" or "OpSpec".

*[a, b]:* This square-bracket notation means the range from *a* to *b*, inclusive of *a* and *b*. Parentheses exclude their end point, so, for example, *(a, b]* means *a* to *b* excluding *a* but including *b*.

## 2.2.2 Types

*Boolean type:* The type returned by [OpTypeBool](#).

*Integer type:* Any width signed or unsigned type from [OpTypeInt](#). By convention, the lowest-order bit will be referred to as bit-number 0, and the highest-order bit as bit-number *Width* - 1.

*Floating-point type:* Any width type from [OpTypeFloat](#).

*Numerical type:* An [integer](#) type or a [floating-point](#) type.

*Scalar:* A single instance of a [numerical type](#) or [Boolean type](#). Scalars will also be called *components* when being discussed either by themselves or in the context of the contents of a [vector](#).

*Vector:* An ordered homogeneous collection of two or more [scalars](#). Vector sizes are quite restrictive and dependent on the execution model.

*Matrix:* An ordered homogeneous collection of vectors. When vectors are part of a matrix, they will also be called *columns*. Matrix sizes are quite restrictive and dependent on the execution model.

*Array:* An ordered homogeneous aggregate of any non-void-type objects. When an object is part of an array, it will also be called an *element*. Array sizes are generally not restricted.

*Structure:* An ordered heterogeneous aggregate of any non-void types. When an object is part of a structure, it will also be called a *member*.

*Aggregate:* A [structure](#) or an [array](#).

*Composite:* An [aggregate](#), a [matrix](#), or a [vector](#).

*Image:* A traditional texture or image; SPIR-V has this single name for these. An image type is declared with [OpTypeImage](#). An image does not include any information about how to access, filter, or sample it.

*Sampler:* Settings that describe how to access, filter, or sample an [image](#). Can come either from literal declarations of settings or be an opaque reference to externally bound settings. A sampler does not include an [image](#).

*Sampled Image:* An [image](#) combined with a [sampler](#), enabling filtered accesses of the image's contents.

*Physical Pointer Type:* An [OpTypePointer](#) whose *Storage Class* uses physical addressing according to the [addressing model](#).

*Logical Pointer Type:* A pointer type that is not a [physical pointer type](#).

*Concrete Type:* A [numerical](#) scalar, vector, or matrix type, or [physical pointer type](#), or any aggregate containing only these types.

*Abstract Type:* An [OpTypeVoid](#) or [OpTypeBool](#), or [logical pointer type](#), or any aggregate type containing any of these.

*Opaque Type:* A type that is, or contains, or points to, or contains pointers to, any of the following types:

- [OpTypeImage](#)
- [OpTypeSampler](#)
- [OpTypeSampledImage](#)
- [OpTypeOpaque](#)
- [OpTypeEvent](#)
- [OpTypeDeviceEvent](#)
- [OpTypeReserveId](#)
- [OpTypeQueue](#)
- [OpTypePipe](#)
- [OpTypeForwardPointer](#)
- [OpTypePipeStorage](#)
- [OpTypeNamedBarrier](#)

*Variable pointer:* A pointer of logical pointer type that results from one of the following instructions:

- [OpSelect](#)
- [OpPhi](#)
- [OpFunctionCall](#)
- [OpPtrAccessChain](#)
- [OpLoad](#)
- [OpConstantNull](#)

Additionally, any [OpAccessChain](#), [OpInBoundsAccessChain](#), or [OpCopyObject](#) that takes a variable pointer as an operand also produces a variable pointer. An [OpFunctionParameter](#) of pointer type is a variable pointer if any [OpFunctionCall](#) to the function statically passes a variable pointer as the value of the parameter.

### 2.2.3 Computation

*Remainder:* When dividing  $a$  by  $b$ , a *remainder*  $r$  is defined to be a value that satisfies  $r + q \times b = a$  where  $q$  is a whole number and  $|r| < |b|$ .

### 2.2.4 Module

*Module:* A single unit of SPIR-V. It can contain multiple [entry points](#), but only one set of [capabilities](#).

*Entry Point:* A function in a [module](#) where execution begins. A single *entry point* is limited to a single [execution model](#). An entry point is declared using [OpEntryPoint](#).

*Execution Model:* A graphical-pipeline stage or OpenCL kernel. These are enumerated in [Execution Model](#).

*Execution Mode:* Modes of operation relating to the interface or execution environment of the module. These are enumerated in [Execution Mode](#). Generally, modes do not change the semantics of instructions within a SPIR-V module.

*Vertex Processor:* Any stage or execution model that processes vertices: Vertex, tessellation control, tessellation evaluation, and geometry. Explicitly excludes fragment and compute execution models.

### 2.2.5 Control Flow

*Block*: A contiguous sequence of instructions starting with an [OpLabel](#), ending with a [termination instruction](#). A *block* has no additional label or termination instructions.

*Branch Instruction*: One of the following, used as a [termination instruction](#):

- [OpBranch](#)
- [OpBranchConditional](#)
- [OpSwitch](#)
- [OpReturn](#)
- [OpReturnValue](#)

*Termination Instruction*: One of the following, used to terminate blocks:

- any [branch instruction](#)
- [OpKill](#)
- [OpUnreachable](#)

*Dominate*: A block *A* dominates a block *B*, where *A* and *B* are in the same function, if every path from the function's entry point to block *B* includes block *A*. *A strictly dominates B* only if *A dominates B* and *A* and *B* are different blocks.

*Post Dominate*: A block *B* post dominates a block *A*, where *A* and *B* are in the same function, if every path from *A* to a function-return instruction goes through block *B*.

*Control-Flow Graph*: The graph formed by a function's blocks and branches. The blocks are the graph's nodes, and the branches the graph's edges.

*CFG*: Control-flow graph.

*Back Edge*: A branch is a *back edge* if there is a depth-first search starting at the entry block of the CFG where the branch branches to one of its ancestors. A *back-edge block* is a block containing such a branch instruction.

Note: For a given function, if all its loops are structured, then each back edge corresponds to exactly one loop header, and vice versa. So the set of back-edges in the function is unique, regardless of the depth-first search used to find them. This is equivalent to the function's CFG being reducible.

*Merge Instruction*: One of the following, used before a branch instruction to declare structured control flow:

- [OpSelectionMerge](#)
- [OpLoopMerge](#)

*Header Block*: A block containing a [merge instruction](#).

*Loop Header*: A [header block](#) whose merge instruction is an [OpLoopMerge](#).

*Merge Block*: A block declared by the *Merge Block* operand of a [merge instruction](#).

*Break Block*: A block containing a branch to the *Merge Block* of a loop header's [merge instruction](#).

*Continue Block*: A block containing a branch to an [OpLoopMerge](#) instruction's *Continue Target*.

*Return Block*: A block containing an [OpReturn](#) or [OpReturnValue](#) branch.

*Invocation*: A single execution of an entry point in a SPIR-V module, operating only on the amount of data explicitly exposed by the semantics of the instructions. (Any implicit operation on additional instances of data would comprise

additional invocations.) For example, in compute execution models, a single invocation operates only on a single work item, or, in a vertex execution model, a single invocation operates only on a single vertex.

*Subgroup:* Invocations are partitioned into subgroups, where invocations within a subgroup can synchronize and share data with each other efficiently. In compute models, the current workgroup is a superset of the subgroup.

*Invocation Group:* The complete set of invocations collectively processing a particular compute workgroup or graphical operation, where the scope of a "graphical operation" is implementation dependent, but at least as large as a single point, line, triangle, or patch, and at most as large as a single rendering command, as defined by the client API.

*Derivative Group:* Defined only for the **Fragment Execution Model**: The set of invocations collectively processing a single point, line, or triangle, including any helper invocations.

*Dynamic Instance:* Within a single invocation, a single static instruction can be executed multiple times, giving multiple dynamic instances of that instruction. This can happen when the instruction is executed in a loop, or in a function called from multiple call sites, or combinations of multiple of these. Different loop iterations and different dynamic function-call-site chains yield different dynamic instances of such an instruction. Dynamic instances are distinguished by the control-flow path within an invocation, not by which [invocation](#) executed it. That is, different invocations of an entry point execute the same dynamic instances of an instruction when they follow the same control-flow path, starting from that entry point.

*Dynamically Uniform:* An [<id>](#) is dynamically uniform for a [dynamic instance](#) consuming it when its value is the same for all invocations (in the [invocation group](#), unless otherwise stated) that execute that dynamic instance.

*Uniform Control Flow:* Uniform control flow (or converged control flow) occurs when all invocations in the [invocation group](#) or [derivative group](#) execute the same control-flow path (and hence the same sequence of [dynamic instances](#) of instructions). Uniform control flow is the initial state at the entry point, and lasts until a conditional branch takes different control paths for different invocations (non-uniform or divergent control flow). Such divergence can reconverge, with all the invocations once again executing the same control-flow path, and this re-establishes the existence of uniform control flow. If control flow is uniform upon entry into a [header block](#), and all invocations leave that dynamic instance of the header block's control-flow construct via the header block's declared merge block, then control flow reconverges to be uniform at that merge block.

## 2.3 Physical Layout of a SPIR-V Module and Instruction

A SPIR-V module is a single linear stream of [words](#). The first words are shown in the following table:

Table 1: First Words of Physical Layout

Word Number	Contents
0	<a href="#">Magic Number</a> .
1	Version number. The bytes are, high-order to low-order:  $0 \mid \text{Major Number} \mid \text{Minor Number} \mid 0$  Hence, version 1.3 is the value 0x00010300.
2	Generator's magic number. It is associated with the tool that generated the module. Its value does not affect any semantics, and is allowed to be 0. Using a non-0 value is encouraged, and can be registered with Khronos at <a href="https://www.khronos.org/registry/spir-v/api/spir-v.xml">https://www.khronos.org/registry/spir-v/api/spir-v.xml</a> .
3	<i>Bound</i> ; where all <a href="#">&lt;id&gt;s</a> in this module are guaranteed to satisfy  $0 < id < Bound$  <i>Bound</i> should be small, smaller is better, with all <a href="#">&lt;id&gt;</a> in a module being densely packed and near 0.
4	0 (Reserved for instruction schema, if needed.)
5	First word of instruction stream, see below.

All remaining words are a linear sequence of instructions.

Each instruction is a stream of [words](#):

Table 2: Instruction Physical Layout

Instruction Word Number	Contents
0	Opcode: The 16 high-order bits are the <a href="#">WordCount</a> of the instruction. The 16 low-order bits are the opcode enumerant.
1	Optional instruction type <a href="#">&lt;id&gt;</a> (presence determined by opcode).
.	Optional instruction <a href="#">Result &lt;id&gt;</a> (presence determined by opcode).
.	Operand 1 (if needed)
.	Operand 2 (if needed)
...	...
<a href="#">WordCount</a> - 1	Operand <i>N</i> ( <i>N</i> is determined by WordCount minus the 1 to 3 words used for the opcode, instruction type <a href="#">&lt;id&gt;</a> , and instruction <a href="#">Result &lt;id&gt;</a> ).

Instructions are variable length due both to having optional instruction type [<id>](#) and [Result <id>](#) words as well as a variable number of operands. The details for each specific instruction are given in the [Binary Form](#) section.

## 2.4 Logical Layout of a Module

The instructions of a SPIR-V module must be in the following order. For sections earlier than function definitions, it is invalid to use instructions other than those indicated.

1. All [OpCapability](#) instructions.
2. Optional [OpExtension](#) instructions (extensions to SPIR-V).
3. Optional [OpExtInstImport](#) instructions.
4. The single required [OpMemoryModel](#) instruction.
5. All entry point declarations, using [OpEntryPoint](#).
6. All [execution-mode](#) declarations, using [OpExecutionMode](#) or [OpExecutionModeId](#).
7. These [debug](#) instructions, which must be grouped in the following order:
  - a. all [OpString](#), [OpSourceExtension](#), [OpSource](#), and [OpSourceContinued](#), without forward references.
  - b. all [OpName](#) and all [OpMemberName](#)
  - c. all [OpModuleProcessed](#) instructions
8. All [annotation](#) instructions:
  - a. all decoration instructions ([OpDecorate](#), [OpMemberDecorate](#), [OpGroupDecorate](#), [OpGroupMemberDecorate](#), and [OpDecorationGroup](#)).
9. All type declarations ([OpTypeXXX](#) instructions), all [constant instructions](#), and all global variable declarations (all [OpVariable](#) instructions whose [Storage Class](#) is not **Function**). This is the preferred location for [OpUndef](#) instructions, though they can also appear in function bodies. All operands in all these instructions must be declared before being used. Otherwise, they can be in any order. This section is the first section to allow use of [OpLine](#) debug information.
10. All function declarations ("declarations" are functions without a body; there is no forward declaration to a function with a body). A function declaration is as follows.
  - a. Function declaration, using [OpFunction](#).
  - b. Function parameter declarations, using [OpFunctionParameter](#).
  - c. Function end, using [OpFunctionEnd](#).
11. All function definitions (functions with a body). A function definition is as follows.
  - a. Function definition, using [OpFunction](#).
  - b. Function parameter declarations, using [OpFunctionParameter](#).
  - c. Block
  - d. Block
  - e. ...
  - f. Function end, using [OpFunctionEnd](#).

Within a function definition:

- A block always starts with an [OpLabel](#) instruction. This may be immediately preceded by an [OpLine](#) instruction, but the **OpLabel** is considered as the beginning of the block.
- A block always ends with a [termination instruction](#) (see [validation rules](#) for more detail).
- All [OpVariable](#) instructions in a function must have a [Storage Class](#) of **Function**.
- All [OpVariable](#) instructions in a function must be in the first block in the function. These instructions, together with any immediately preceding [OpLine](#) instructions, must be the first instructions in that block. (Note the validation rules prevent [OpPhi](#) instructions in the first block of a function.)

- A function definition (starts with [OpFunction](#)) can be immediately preceded by an [OpLine](#) instruction.

Forward references (an operand *<id>* that appears before the [Result <id>](#) defining it) are allowed for:

- Operands that are an [OpFunction](#). This allows for recursion and early declaration of entry points.
- [Annotation](#)-instruction operands. This is required to fully know everything about a type or variable once it is declared.
- Labels.
- [OpPhi](#) can contain forward references.
- An [OpTypeForwardPointer](#) has a forward reference to an [OpTypePointer](#).
- An [OpTypeStruct](#) operand that's a forward reference to the *Pointer Type* operand to an [OpTypeForwardPointer](#).
- The list of *<id>* provided in the [OpEntryPoint](#) instruction.
- [OpExecutionModeId](#).

In all cases, there is enough type information to enable a single simple pass through a module to transform it. For example, function calls have all the type information in the call, phi-functions don't change type, and labels don't have type. The pointer forward reference allows structures to contain pointers to themselves or to be mutually recursive (through pointers), without needing additional type information.

The [Validation Rules](#) section lists additional rules that must be satisfied.

## 2.5 Instructions

Most instructions create a [Result <id>](#), as provided in the *Result <id>* field of the instruction. These *Result <id>*s are then referred to by other instructions through their *<id>* operands. All instruction operands are specified in the [Binary Form](#) section.

Instructions are explicit about whether an operand is (or is part of) a self-contained [literal](#) or an *<id>* referring to another instruction's result. While an *<id>* always takes one operand, one literal can take one or more operands. Some common examples of [literals](#):

- A literal 32-bit (or smaller) integer is always one operand directly holding a 32-bit two's-complement value.
- A literal 32-bit float is always one operand, directly holding a 32-bit IEEE 754 floating-point representation.
- A literal 64-bit float is always two operands, directly holding a 64-bit IEEE 754 representation. The low-order 32 bits appear in the first operand.

### 2.5.1 SSA Form

A module is always in static single assignment (SSA) form. That is, there is always exactly one instruction resulting in any particular [Result <id>](#). Storing into variables declared in memory is not subject to this; such stores do not create *Result <id>*s. Accessing declared variables is done through:

- [OpVariable](#) to allocate an object in memory and create a *Result <id>* that is the name of a pointer to it.
- [OpAccessChain](#) or [OpInBoundsAccessChain](#) to create a pointer to a subpart of a [composite](#) object in memory.
- [OpLoad](#) through a pointer, giving the loaded object a *Result <id>* that can then be used as an operand in other instructions.
- [OpStore](#) through a pointer, to write a value. There is no *Result <id>* for an [OpStore](#).

[OpLoad](#) and [OpStore](#) instructions can often be eliminated, using [intermediate](#) results instead. When this happens in multiple control-flow paths, these values need to be merged again at the path's merge point. Use [OpPhi](#) to merge such values together.

## 2.6 Entry Point and Execution Model

The [OpEntryPoint](#) instruction identifies an [entry point](#) with two key things: an execution model and a function definition. Execution models include **Vertex**, **GLCompute**, etc. (one for each graphical stage), as well as **Kernel** for OpenCL kernels. For the complete list, see [Execution Model](#). An [OpEntryPoint](#) also supplies a name that can be used externally to identify the entry point, and a declaration of all the **Input** and **Output** variables that form its input/output interface.

The static function call graphs rooted at two entry points are allowed to overlap, so that function definitions and global variable definitions can be shared. The execution model and any execution modes associated with an entry point apply to the entire static function call graph rooted at that entry point. This rule implies that a function appearing in both call graphs of two distinct entry points may behave differently in each case. Similarly, variables whose semantics depend on properties of an entry point, e.g. those using the [Input Storage Class](#), may behave differently when used in call graphs rooted in two different entry points.

## 2.7 Execution Modes

Information like the following is declared with [OpExecutionMode](#) instructions. For example,

- number of invocations (**Invocations**)
- vertex-order CCW (**VertexOrderCcw**)
- triangle strip generation (**OutputTriangleStrip**)
- number of output vertices (**OutputVertices**)
- etc.

For a complete list, see [Execution Mode](#).

## 2.8 Types and Variables

Types are built up hierarchically, using [OpTypeXXX](#) instructions. The [Result <id>](#) of an [OpTypeXXX](#) instruction becomes a type [<id>](#) for future use where type [<id>](#)s are needed (therefore, [OpTypeXXX](#) instructions do not have a type [<id>](#), like most other instructions do).

The "leaves" to start building with are types like [OpTypeFloat](#), [OpTypeInt](#), [OpTypeImage](#), [OpTypeEvent](#), etc. Other types are built up from the [Result <id>](#) of these. The numerical types are parameterized to specify bit width and signed vs. unsigned.

Higher-level types are then constructed using opcodes like [OpTypeVector](#), [OpTypeMatrix](#), [OpTypeImage](#), [OpTypeArray](#), [OpTypeRuntimeArray](#), [OpTypeStruct](#), and [OpTypePointer](#). These are parameterized by number of components, array size, member lists, etc. The image types are parameterized by the return type, dimensionality, arrayness, etc. To do sampling or filtering operations, a type from [OpTypeSampledImage](#) is used that contains both an [image](#) and a [sampler](#). Such a [sampled image](#) can be set directly by the client API or combined in a SPIR-V module from an independent image and an independent sampler.

Types are built bottom up: A parameterizing operand in a type must be defined before being used.

Some additional information about the type of an [<id>](#) can be provided using the decoration instructions ([OpDecorate](#), [OpMemberDecorate](#), [OpGroupDecorate](#), [OpGroupMemberDecorate](#), and [OpDecorationGroup](#)). These can add, for example, **Invariant** to an [<id>](#) created by another instruction. See the full list of [Decorations](#) in the [Binary Form](#) section.

Two different type [<id>](#)s form, by definition, two different types. It is valid to declare multiple [aggregate](#) type [<id>](#)s having the same opcode and operands. This is to allow multiple instances of aggregate types with the same structure to be [decorated](#) differently. (Different decorations are not required; two different aggregate type [<id>](#)s are allowed to have identical declarations and decorations, and will still be two different types.) Pointer types are also allowed to have multiple [<id>](#)s for the same opcode and operands, to allow for differing decorations (e.g., **Volatile**) or different decoration values

(e.g., different *Array Stride* values for the **ArrayStride**). When new pointers are formed, their types must be decorated as needed, so the consumer knows how to generate an access through the pointer. Non-aggregate non-pointer types are different: It is invalid to declare multiple type *<id>s* for the same scalar, vector, or matrix type. That is, non-aggregate non-pointer type declarations must all have different opcodes or operands. (Note that non-aggregate non-pointer types cannot be decorated in ways that affect their type.)

Variables are declared to be of an already built type, and placed in a Storage Class. Storage classes include **UniformConstant**, **Input**, **Workgroup**, etc. and are fully specified in [Storage Class](#). Variables declared with the **Function** Storage Class can have their lifetime's specified within their function using the [OpLifetimeStart](#) and [OpLifetimeStop](#) instructions.

Intermediate results are typed by the instruction's type *<id>*, which must validate with respect to the operation being done.

Built-in variables have special semantics and are declared using [OpDecorate](#) or [OpMemberDecorate](#) with the **BuiltIn Decoration**, followed by a **BuiltIn** enumerator. See the [BuiltIn](#) section for details on what can be decorated as a built-in variable.

### 2.8.1 Unsigned Versus Signed Integers

The integer type, [OpTypeInt](#), is parameterized not only with a size, but also with signedness. There are two typical ways to think about signedness in SPIR-V, both equally valid:

1. As if all integers are "signless", meaning they are neither signed nor unsigned: All **OpTypeInt** instructions select a signedness of 0 to conceptually mean "no sign" (rather than "unsigned"). This is useful when translating from a language that does not distinguish between signed and unsigned types. The type of operation (signed or unsigned) to perform is always selected by the choice of opcode.
2. As if some integers are signed, and some are unsigned: Some **OpTypeInt** instructions select signedness of 0 to mean "unsigned" and some select signedness of 1 to mean "signed". This is useful when signedness matters to external interface, or when targeting a higher-level language that cares about types being signed and unsigned. The type of operation (signed or unsigned) to perform is still always selected by the choice of opcode, but a small amount of validation can be done where it is non-sensible to use a signed type.

Note in both cases all signed and unsigned operations always work on unsigned types, and the semantics of operation come from the opcode. SPIR-V does not know which way is being used; it is set up to support both ways of thinking.

Note that while SPIR-V aims to not assign semantic meaning to the signedness bit in choosing how to operate on values, there are a few cases known to do this, all confined to modules declaring the **Shader** capability:

- validation for consistency checking for front ends for directly contradictory usage, where explicitly indicated in this specification
- interfaces that might require widening of an input value, and otherwise don't know whether to sign extend or zero extend, including the following bullet
- an image read that might require widening of an operand, in versions where the **SignExtend** and **ZeroExtend image operands** are not available (when available, these operands are the supported way to communicate this).

## 2.9 Function Calling

To call a function defined in the current module or a function declared to be imported from another module, use [OpFunctionCall](#) with an operand that is the *<id>* of the [OpFunction](#) to call, and the *<id>s* of the arguments to pass. All arguments are passed by value into the called function. This includes pointers, through which a callee object could be modified.

## 2.10 Extended Instruction Sets

Many operations and/or built-in function calls from high-level languages are represented through *extended instruction sets*. Extended instruction sets will include things like

- trigonometric functions: `sin()`, `cos()`, ...
- exponentiation functions: `exp()`, `pow()`, ...
- geometry functions: `reflect()`, `smoothstep()`, ...
- functions having rich performance/accuracy trade-offs
- etc.

Non-extended instructions, those that are core SPIR-V instructions, are listed in the [Binary Form](#) section. Native operations include:

- Basic arithmetic: `+`, `-`, `*`, `min()`, scalar \* vector, etc.
- Texturing, to help with back-end decoding and support special code-motion rules.
- Derivatives, due to special code-motion rules.

Extended instruction sets are specified in independent specifications. They can be referenced (but not specified) in this specification. The separate extended instruction set specification will specify instruction opcodes, semantics, and instruction names.

To use an extended instruction set, first import it by name string using [OpExtInstImport](#) and giving it a [Result <id>](#):

```
<extinst-id> OpExtInstImport "name-of-extended-instruction-set"
```

Where "name-of-extended-instruction-set" is a [literal](#) string. The standard convention for this string is

```
"<source language name>.<package name>.<version>"
```

For example "GLSL.std.450" could be the name of the core built-in functions for GLSL versions 450 and earlier.

---

### Note

There is nothing precluding having two "mirror" sets of instructions with different names but the same opcode values, which could, for example, let modifying just the import statement to change a performance/accuracy trade off.

---

Then, to call a specific extended instruction, use [OpExtInst](#):

```
OpExtInst <extinst-id> instruction-number operand0, operand1, ...
```

Extended instruction-set specifications will provide semantics for each "instruction-number". It is up to the specific specification what the overloading rules are on operand type. The specification must be clear on its semantics, and producers/consumers of it must follow those semantics.

By convention, it is recommended that all external specifications include an **enum** `{...}` listing all the "instruction-numbers", and a mapping between these numbers and a string representing the instruction name. However, there are no requirements that instruction name strings are provided or mangled.

---

### Note

Producing and consuming extended instructions can be done entirely through numbers (no string parsing). An extended instruction set specification provides opcode enumerant values for the instructions, and these will be produced by the front end and consumed by the back end.

---

## 2.11 Structured Control Flow

SPIR-V can explicitly declare structured control-flow *constructs* using [merge instructions](#). These explicitly declare a [header block](#) before the control flow diverges and a [merge block](#) where control flow subsequently converges. These blocks delimit constructs that must nest, and can only be entered and exited in structured ways, as per the following.

Structured control-flow declarations must satisfy the following rules:

- the [merge block](#) declared by a [header block](#) cannot be a merge block declared by any other header block
- each [header block](#) must [strictly dominate](#) its [merge block](#), unless the merge block is unreachable in the CFG
- all CFG [back edges](#) must branch to a [loop header](#), with each [loop header](#) having exactly one back edge branching to it
- for a given loop header, its [OpLoopMerge Continue Target](#), and corresponding back-edge block:
  - the *loop header* must dominate the *Continue Target*, unless the *Continue Target* is unreachable in the CFG
  - the *Continue Target* must dominate the back-edge block
  - the back-edge block must post dominate the *Continue Target*

A structured control-flow *construct* is then defined as one of:

- a *selection construct*: the set of blocks dominated by a selection header, minus the set of blocks dominated by the header's merge block
- a *continue construct*: the set of blocks dominated by an [OpLoopMerge's Continue Target](#) and post dominated by the corresponding back-edge block
- a *loop construct*: the set of blocks dominated by a [loop header](#), minus the set of blocks dominated by the loop's merge block, minus the loop's corresponding *continue construct*
- a *case construct*: the set of blocks dominated by an [OpSwitch Target](#) or *Default*, minus the set of blocks dominated by the **OpSwitch's** merge block (this construct is only defined for those **OpSwitch Target** or *Default* that are not equal to the **OpSwitch's** corresponding merge block)

The above structured control-flow constructs must satisfy the following rules:

- when a construct contains another header block, it also contains that header's corresponding merge block if that merge block is reachable in the CFG
- all branches into a construct from reachable blocks outside the construct must be to the header block
- the only blocks in a construct that can branch outside the construct are
  - a block branching to the construct's merge block
  - a block branching from one *case construct* to another, for the same **OpSwitch**
  - a back-edge block
  - a [continue block](#) for the innermost loop it is nested inside of
  - a [break block](#) for the innermost loop it is nested inside of
  - a [return block](#)
- additionally for switches:
  - an **OpSwitch** block dominates all its defined *case constructs*
  - each *case construct* has at most one branch to another *case construct*
  - each *case construct* is branched to by at most one other *case construct*
  - if *Target T1* branches to *Target T2*, or if *Target T1* branches to the *Default* and the *Default* branches to *Target T2*, then *T1* must immediately precede *T2* in the list of the [OpSwitch Target](#) operands

## 2.12 Specialization

*Specialization* is intended for constant objects that will not have known constant values until after initial generation of a SPIR-V module. Such objects are called *specialization constants*.

A SPIR-V module containing specialization constants can consume one or more externally provided *specializations*: A set of final constant values for some subset of the module's *specialization constants*. Applying these final constant values yields a new module having fewer remaining specialization constants. A module also contains default values for any specialization constants that never get externally specialized.

---

### Note

No optimizing transforms are required to make a *specialized* module functionally correct. The specializing transform is straightforward and explicitly defined below.

---

---

### Note

Ad hoc specializing should not be done through constants ([OpConstant](#) or [OpConstantComposite](#)) that get overwritten: A SPIR-V  $\rightarrow$  SPIR-V transform might want to do something irreversible with the value of such a constant, unconstrained from the possibility that its value could be later changed.

---

Within a module, a *Specialization Constant* is declared with one of these instructions:

- [OpSpecConstantTrue](#)
- [OpSpecConstantFalse](#)
- [OpSpecConstant](#)
- [OpSpecConstantComposite](#)
- [OpSpecConstantOp](#)

The *literal* operands to [OpSpecConstant](#) are the default numerical specialization constants. Similarly, the "True" and "False" parts of [OpSpecConstantTrue](#) and [OpSpecConstantFalse](#) provide the default Boolean specialization constants. These default values make an external specialization optional. However, such a default constant is applied only after all external specializations are complete, and none contained a specialization for it.

An external specialization is provided as a logical list of pairs. Each pair is a **SpecId Decoration** of a scalar specialization instruction along with its specialization constant. The numeric values are exactly what the operands would be to a corresponding [OpConstant](#) instruction. Boolean values are true if non-zero and false if zero.

Specializing a module is straightforward. The following specialization-constant instructions can be updated with specialization constants, and replaced in place, leaving everything else in the module exactly the same:

```
OpSpecConstantTrue -> OpConstantTrue or OpConstantFalse
OpSpecConstantFalse -> OpConstantTrue or OpConstantFalse
OpSpecConstant -> OpConstant
OpSpecConstantComposite -> OpConstantComposite
```

The [OpSpecConstantOp](#) instruction is specialized by executing the operation and replacing the instruction with the result. The result can be expressed in terms of a [constant instruction](#) that is not a specialization-constant instruction. (Note, however, this resulting instruction might not have the same size as the original instruction, so is not a "replaced in place" operation.)

When applying an external specialization, the following (and only the following) must be modified to be non-specialization-constant instructions:

- specialization-constant instructions with values provided by the specialization

- specialization-constant instructions that consume nothing but non-specialization constant instructions (including those that the partial specialization transformed from specialization-constant instructions; these are in order, so it is a single pass to do so)

A full specialization can also be done, when requested or required, in which all specialization-constant instructions will be modified to non-specialization-constant instructions, using the default values where required.

## 2.13 Linkage

The ability to have partially linked modules and libraries is provided as part of the [Linkage](#) capability.

By default, functions and global variables are private to a module and cannot be accessed by other modules. However, a module may be written to *export* or *import* functions and global (module scope) variables. Imported functions and global variable definitions are resolved at linkage time. A module is considered to be partially linked if it depends on imported values.

Within a module, imported or exported values are decorated using the **Linkage Attributes Decoration**. This decoration assigns the following linkage attributes to decorated values:

- A [Linkage Type](#).
- A *name*, interpreted as a [literal](#) string, is used to uniquely identify exported values.

---

### Note

When resolving imported functions, the [Function Control](#) and all [Function Parameter Attributes](#) are taken from the function definition, and not from the function declaration.

---

## 2.14 Relaxed Precision

The **RelaxedPrecision Decoration** allows 32-bit integer and 32-bit floating-point operations to execute with a relaxed precision of somewhere between 16 and 32 bits.

For a floating-point operation, operating at relaxed precision means that the minimum requirements for range and precision are as follows:

- the floating point range may be as small as  $(-2^{14}, 2^{14})$
- the floating point magnitude range must include 0.0 and  $[2^{-14}, 2^{14})$
- the relative floating point precision may be as small as  $2^{-10}$

The [range notation](#) here means the largest required magnitude is half of the relative precision less than the value given.

Relative floating-point precision is defined as the worst case (i.e. largest) ratio of the smallest step in relation to the value for all non-zero values in the required range:

$$\text{Precision}_{\text{relative}} = (\text{abs}(v_1 - v_2)_{\min} / \text{abs}(v_1))_{\max} \text{ for } v_1 \neq 0, v_2 \neq 0, v_1 \neq v_2$$

It is therefore twice the maximum rounding error when converting from a real number. Subnormal numbers may be supported and may have lower relative precision.

For integer operations, operating at relaxed precision means that the operation will be evaluated by an operation in which, for some  $N$ ,  $16 \leq N \leq 32$ :

- the operation is executed as though its type were  $N$  bits in size, and
- the result is zero or sign extended to 32 bits as determined by the signedness of the result type of the operation.

The **RelaxedPrecision** Decoration can be applied to:

- The **<id>** of a variable, where the variable's type is a scalar, vector, or matrix, or an array of scalar, vector, or matrix. In all cases, the components in the type must be a 32-bit **numerical** type.
- The **Result <id>** of an instruction that operates on numerical types, meaning the instruction is to operate at relaxed precision. The instruction's operands may also be truncated to the relaxed precision.
- The **Result <id>** of an instruction that reads or filters from an image. E.g. **OpImageSampleExplicitLod**, meaning the instruction is to operate at relaxed precision.
- The **Result <id>** of an **OpFunction** meaning the function's returned result is at relaxed precision. It cannot be applied to **OpTypeFunction** or to an **OpFunction** whose return type is **OpTypeVoid**.
- A structure-type member (through **OpMemberDecorate**).

When applied to a variable or structure member, all loads and stores from the decorated object may be treated as though they were decorated with **RelaxedPrecision**. Loads may also be decorated with **RelaxedPrecision**, in which case they are treated as operating at relaxed precision.

All loads and stores involving relaxed precision still read and write 32 bits of data, respectively. Floating-point data read or written in such a manner is written in full 32-bit floating-point format. However, a load or store might reduce the precision (as allowed by **RelaxedPrecision**) of the destination value.

For debugging portability of floating-point operations, **OpQuantizeToF16** may be used to explicitly reduce the precision of a relaxed-precision result to 16-bit precision. (Integer-result precision can be reduced, for example, using left- and right-shift opcodes.)

For image-sampling operations, decorations can appear on both the sampling instruction and the image variable being sampled. If either is decorated, they both should be decorated, and when both are decorated their decorations must match. If only one is decorated, the sampling instruction can behave either as if both were decorated or neither were decorated.

## 2.15 Debug Information

Debug information is supplied with:

- Source-code text through **OpString**, **OpSource**, and **OpSourceContinued**.
- Object names through **OpName** and **OpMemberName**.
- Line numbers through **OpLine**.

A module will not lose any semantics when all such instructions are removed.

### 2.15.1 Function-Name Mangling

There is no functional dependency on how functions are named. Signature-typing information is explicitly provided, without any need for name "unmangling". (Valid modules can be created without inclusion of mangled names.)

By convention, for debugging purposes, modules with **OpSource** *Source Language* of OpenCL use the Itanium name-mangling standard.

## 2.16 Validation Rules

### 2.16.1 Universal Validation Rules

All modules must obey the following, or it is an invalid module:

- The stream of instructions must be ordered as described in the [Logical Layout](#) section.
- Any use of a feature described by a capability in the [capability](#) section requires that capability to be declared, either directly, or as an "implicitly declares" capability on a capability that is declared.
- Non-structure types (scalars, vectors, arrays, etc.) with the same operand parameterization cannot be type aliases. For non-structures, two type *<id>s* match if-and-only-if the types match.
- When using [OpBitcast](#) to convert pointers to/from vectors of integers, only vectors of 32-bit integers are allowed.
- If neither the **VariablePointers** nor **VariablePointersStorageBuffer** capabilities are declared, the following rules apply to [logical pointer types](#):
  - [OpVariable](#) cannot allocate an object whose type is or contains a logical pointer type.
  - A pointer can only be an operand to the following instructions:
    - \* [OpLoad](#)
    - \* [OpStore](#)
    - \* [OpAccessChain](#)
    - \* [OpInBoundsAccessChain](#)
    - \* [OpFunctionCall](#)
    - \* [OpImageTexelPointer](#)
    - \* [OpCopyMemory](#)
    - \* [OpCopyObject](#)
    - \* all [OpAtomic](#) instructions
    - \* extended instruction-set instructions that are explicitly identified as taking pointer operands
  - A pointer can be the [Result <id>](#) of only the following instructions:
    - \* [OpVariable](#)
    - \* [OpAccessChain](#)
    - \* [OpInBoundsAccessChain](#)
    - \* [OpFunctionParameter](#)
    - \* [OpImageTexelPointer](#)
    - \* [OpCopyObject](#)
  - All indexes in [OpAccessChain](#) and [OpInBoundsAccessChain](#) that are [OpConstant](#) with type of [OpTypeInt](#) with a *signedness* of 1 must not have their sign bit set.
  - Any pointer operand to an [OpFunctionCall](#) must point into one of the following [storage classes](#):
    - \* **UniformConstant**
    - \* **Function**
    - \* **Private**
    - \* **Workgroup**
    - \* **AtomicCounter**
  - Any pointer operand to an [OpFunctionCall](#) must be
    - \* a [memory object declaration](#), or
    - \* a pointer to an element in an array that is a memory object declaration, where the element type is [OpTypeSampler](#) or [OpTypeImage](#).
  - The instructions [OpPtrEqual](#) and [OpPtrNotEqual](#) cannot be used.
- If the **VariablePointers** or **VariablePointersStorageBuffer** capability is declared, the following are allowed for [logical pointer types](#):
  - [OpVariable](#) can allocate an object whose type is or contains a [logical pointer type](#) that could be a valid variable pointer, if the *Storage Class* operand of the **OpVariable** is one of the following:
    - \* **Function**
    - \* **Private**

- A pointer can be the *Object* operand of **OpStore** or result of **OpLoad**, if the storage class the pointer is stored to or loaded from is one of the following:
  - \* **Function**
  - \* **Private**
- A pointer type can be the:
  - \* *Result Type* of **OpFunction**
  - \* *Result Type* of **OpFunctionCall**
  - \* *Return Type* of **OpTypeFunction**
- A pointer can be a **variable pointer** or an operand to one of:
  - \* **OpPtrAccessChain**
  - \* **OpPtrEqual**
  - \* **OpPtrNotEqual**
  - \* **OpPtrDiff**
- A **variable pointer** must point to one of the following **storage classes**:
  - \* **StorageBuffer**
  - \* **Workgroup** (if the **VariablePointers** **capability** is declared)
- If the **VariablePointers** **capability** is not declared, a variable pointer must be selected from pointers pointing into the same structure or be **OpConstantNull**.
- A pointer operand to **OpFunctionCall** can point into the **storage class**:
  - \* **StorageBuffer**
- For pointer operands to **OpFunctionCall**, the **memory object declaration**-restriction is removed for the following **storage classes**:
  - \* **StorageBuffer**
  - \* **Workgroup**
- The instructions **OpPtrEqual** and **OpPtrNotEqual** can be used only when the **Storage Class** of the operands' **OpTypePointer** declaration is
  - \* **StorageBuffer** when the **VariablePointersStorageBuffer** **capability** is explicitly or implicitly declared, or
  - \* **Workgroup**, which can be used only if the **VariablePointers** **capability** was declared.
- A **variable pointer** cannot:
  - be an operand to an **OpArrayLength** instruction
  - point to an object that is or contains an **OpTypeMatrix**
  - point to a column, or a component in a column, within an **OpTypeMatrix**
- Memory model
  - If **OpLoad**, **OpStore**, **OpCopyMemory**, or **OpCopyMemorySized** use **MakePointerAvailable** or **MakePointerVisible**, the optional scope operand must be present.
  - If **OpImageRead**, **OpImageSparseRead**, or **OpImageWrite** use **MakeTexelAvailable** or **MakeTexelVisible**, the optional scope operand must be present.
  - Memory accesses that use **NonPrivatePointer** must use pointers in the **Uniform**, **Workgroup**, **CrossWorkgroup**, **Generic**, **Image**, or **StorageBuffer** **storage classes**.
  - If the **Vulkan** **memory model** is declared and any instruction uses **Device scope**, the **VulkanMemoryModelDeviceScope** **capability** must be declared.
- Physical storage buffer
  - If the **addressing model** is not **PhysicalStorageBuffer64**, then the **PhysicalStorageBuffer** **storage class** must not be used.

- **OpVariable** must not use the **PhysicalStorageBuffer storage class**.
  - If the type an **OpVariable** points to is a pointer (or array of pointers) in the **PhysicalStorageBuffer storage class**, the **OpVariable** must be decorated with exactly one of **AliasedPointer** or **RestrictPointer**.
  - If an **OpFunctionParameter** is a pointer (or array of pointers) in the **PhysicalStorageBuffer storage class**, the function parameter must be decorated with exactly one of **Aliased** or **Restrict**.
  - If an **OpFunctionParameter** is a pointer (or array of pointers) and the type it points to is a pointer in the **PhysicalStorageBuffer storage class**, the function parameter must be decorated with exactly one of **AliasedPointer** or **RestrictPointer**.
  - Any pointer value whose **storage class** is **PhysicalStorageBuffer** and that points to a matrix, an array of matrices, or a row or element of a matrix must be the result of an **OpAccessChain** or **OpPtrAccessChain** instruction whose *Base* operand is a structure type (or recursively must be the result of a sequence of only access chains from a structure to the final value). Such a pointer must only be used as the *Pointer* operand to **OpLoad** or **OpStore**.
  - The result of **OpConstantNull** must not be a pointer into the **PhysicalStorageBuffer storage class**.
  - Operands to **OpPtrEqual**, **OpPtrNotEqual**, and **OpPtrDiff** must not be pointers into the **PhysicalStorageBuffer storage class**.
- SSA
    - Each **<id>** must appear exactly once as the **Result <id>** of an instruction.
    - The definition of an SSA **<id>** should dominate all uses of it, with the following exceptions:
      - \* Function calls may call functions not yet defined. However, note that the function’s argument and return types will already be known at the call site.
      - \* An **OpPhi** can consume definitions that do not dominate it.
- Entry Point
    - There is at least one **OpEntryPoint** instruction, unless the **Linkage** capability is being used.
    - No function can be targeted by both an **OpEntryPoint** instruction and an **OpFunctionCall** instruction.
    - Each **OpEntryPoint** can have set at most one of the **DenormFlushToZero** or **DenormPreserve execution modes** for any given *Target Width*.
    - Each **OpEntryPoint** can have set at most one of the **RoundingModeRTE** or **RoundingModeRTZ execution modes** for any given *Target Width*.
- Functions
    - A function declaration (an **OpFunction** with no basic blocks), must have a **Linkage Attributes Decoration** with the **Import Linkage Type**.
    - A function definition (an **OpFunction** with basic blocks) cannot be decorated with the **Import Linkage Type**.
    - A function cannot have both a declaration and a definition (no forward declarations).
- Global (Module Scope) Variables
    - It is illegal to initialize an imported variable. This means that a module-scope **OpVariable** with initialization value cannot be marked with the **Import Linkage Type**.
- Control-Flow Graph (CFG)
    - Blocks exist only within a function.
    - The first block in a function definition is the entry point of that function and cannot be the target of any branch. (Note this means it will have no **OpPhi** instructions.)
    - The order of blocks in a function must satisfy the rule that blocks appear before all blocks they dominate.
    - Each block starts with a label.
      - \* A label is made by **OpLabel**.

- \* This includes the first block of a function (**OpFunction** is not a label).
- \* Labels are used only to form blocks.
- The last instruction of each block is a [termination instruction](#).
- [Termination instructions](#) can only appear as the last instruction in a block.
- [OpLabel](#) instructions can only appear within a function.
- All [branches](#) within a function must be to labels in that function.
- All [OpFunctionCall](#) *Function* operands are an [<id>](#) of an [OpFunction](#) in the same module.
- Data rules
  - Scalar floating-point types can be parameterized only as 32 bit, plus any additional sizes enabled by [capabilities](#).
  - Scalar integer types can be parameterized only as 32 bit, plus any additional sizes enabled by [capabilities](#).
  - Vector types can only be parameterized with numerical types or the [OpTypeBool](#) type.
  - Vector types for can only be parameterized as having 2, 3, or 4 components, plus any additional sizes enabled by [capabilities](#).
  - Matrix types can only be parameterized with floating-point types.
  - Matrix types can only be parameterized as having only 2, 3, or 4 columns.
  - Specialization constants (see [Specialization](#)) are limited to integers, Booleans, floating-point numbers, and vectors of these.
  - Forward reference operands in an [OpTypeStruct](#)
    - \* must be later declared with [OpTypePointer](#)
    - \* the type pointed to must be an [OpTypeStruct](#)
    - \* had an earlier [OpTypeForwardPointer](#) forward reference to the same [<id>](#)
  - All [OpSampledImage](#) instructions must be in the same block in which their *Result <id>* are consumed. *Result <id>* from **OpSampledImage** instructions must not appear as operands to [OpPhi](#) instructions or [OpSelect](#) instructions, or any instructions other than the image lookup and query instructions specified to take an operand whose type is [OpTypeSampledImage](#).
  - Instructions for extracting a scalar image or scalar sampler out of a composite must only use [dynamically-uniform](#) indexes. They must be in the same block in which their *Result <id>* are consumed. Such *Result <id>* must not appear as operands to [OpPhi](#) instructions or [OpSelect](#) instructions, or any instructions other than the image instructions specified to operate on them.
  - The [capabilities](#) **StorageBuffer16BitAccess**, **UniformAndStorageBuffer16BitAccess**, **StoragePushConstant16**, and **StorageInputOutput16** do not generally add 16-bit operations. Rather, they add only the following specific abilities:
    - \* An [OpTypePointer](#) pointing to a 16-bit scalar, a 16-bit vector, or a composite containing a 16-bit member can be used as the result type of [OpVariable](#), or [OpAccessChain](#), or [OpInBoundsAccessChain](#).
    - \* [OpLoad](#) can load 16-bit scalars, 16-bit vectors, and 16-bit matrices.
    - \* [OpStore](#) can store 16-bit scalars, 16-bit vectors, and 16-bit matrices.
    - \* [OpCopyObject](#) can be used for 16-bit scalars or composites containing 16-bit members.
    - \* 16-bit scalars or 16-bit vectors can be used as operands to a width-only conversion instruction to another allowed type ([OpFConvert](#), [OpSConvert](#), or [OpUConvert](#)), and can be produced as results of a width-only conversion instruction from another allowed type.
    - \* A structure containing a 16-bit member can be an operand to [OpArrayLength](#).
  - The [capabilities](#) **StorageBuffer8BitAccess**, **UniformAndStorageBuffer8BitAccess**, and **StoragePushConstant8**, do not generally add 8-bit operations. Rather, they add only the following specific abilities:
    - \* An [OpTypePointer](#) pointing to an 8-bit scalar, an 8-bit vector, or a composite containing an 8-bit member can be used as the result type of [OpVariable](#), or [OpAccessChain](#), or [OpInBoundsAccessChain](#).
    - \* [OpLoad](#) can load 8-bit scalars and vectors.
    - \* [OpStore](#) can store 8-bit scalars and 8-bit vectors.
    - \* [OpCopyObject](#) can be used for 8-bit scalars or composites containing 8-bit members.

- \* 8-bit scalars and vectors can be used as operands to a width-only conversion instruction to another allowed type ([OpSConvert](#), or [OpUConvert](#)), and can be produced as results of a width-only conversion instruction from another allowed type.
- \* A structure containing an 8-bit member can be an operand to [OpArrayLength](#).
- Decoration rules
  - The **Linkage Attributes Decoration** cannot be applied to functions targeted by an [OpEntryPoint](#) instruction.
  - A [BuiltIn Decoration](#) can only be applied as follows:
    - \* When applied to a structure-type member, all members of that structure type must also be [decorated](#) with **BuiltIn**. (No allowed mixing of built-in variables and non-built-in variables within a single structure.)
    - \* When applied to a structure-type member, that structure type cannot be contained as a member of another structure type.
    - \* There is at most one object per Storage Class that can contain a structure type containing members [decorated](#) with **BuiltIn**, consumed per entry-point.
- [OpLoad](#) and [OpStore](#) can only consume objects whose type is a pointer.
- A [Result <id>](#) resulting from an instruction within a function can only be used in that function.
- A function call must have the same number of arguments as the function definition (or declaration) has parameters, and their respective types must match.
- An instruction requiring a specific number of operands must have that many operands. The [word count](#) must agree.
- Each opcode specifies its own requirements for number and type of operands, and these must be followed.
- Atomic access rules
  - The pointers taken by atomic operation instructions must be a pointer into one of the following [Storage Classes](#):
    - \* **Uniform** when used with the **BufferBlock Decoration**
    - \* **StorageBuffer**
    - \* **PhysicalStorageBuffer**
    - \* **Workgroup**
    - \* **CrossWorkgroup**
    - \* **Generic**
    - \* **AtomicCounter**
    - \* **Image**
    - \* **Function**
- It is invalid to have a construct that uses the **StorageBuffer Storage Class** and a construct that uses the **Uniform Storage Class** with the **BufferBlock Decoration** in the same SPIR-V module.
- All [XfbStride Decorations](#) must be the same for all objects decorated with the same **XfbBuffer XFB Buffer Number**.
- All [Stream Decorations](#) must be the same for all objects decorated with the same **XfbBuffer XFB Buffer Number**.

## 2.16.2 Validation Rules for Shader Capabilities

- CFG:
  - Loops must be structured, having an [OpLoopMerge](#) instruction in their header.
  - Selections must be structured, having an [OpSelectionMerge](#) instruction in their header.
- Entry point and execution model
  - Each [entry point](#) in a module, along with its corresponding static call tree within that module, forms a complete pipeline stage.

- Each **OpEntryPoint** with the **Fragment Execution Model** must have an **OpExecutionMode** for either the **OriginLowerLeft** or the **OriginUpperLeft Execution Mode**. (Exactly one of these is required.)
  - An **OpEntryPoint** with the **Fragment Execution Model** can set at most one of the **DepthGreater**, **DepthLess**, or **DepthUnchanged Execution Modes**.
  - An **OpEntryPoint** with one of the **Tessellation Execution Models** can set at most one of the **SpacingEqual**, **SpacingFractionalEven**, or **SpacingFractionalOdd Execution Modes**.
  - An **OpEntryPoint** with one of the **Tessellation Execution Models** can set at most one of the **Triangles**, **Quads**, or **Isolines Execution Modes**.
  - An **OpEntryPoint** with one of the **Tessellation Execution Models** can set at most one of the **VertexOrderCw** or **VertexOrderCcw Execution Modes**.
  - An **OpEntryPoint** with the **Geometry Execution Model** must set exactly one of the **InputPoints**, **InputLines**, **InputLinesAdjacency**, **Triangles**, or **TrianglesAdjacency Execution Modes**.
  - An **OpEntryPoint** with the **Geometry Execution Model** must set exactly one of the **OutputPoints**, **OutputLineStrip**, or **OutputTriangleStrip Execution Modes**.
- **Composite** objects in the **StorageBuffer**, **PhysicalStorageBuffer**, **Uniform**, and **PushConstant Storage Classes** must be explicitly laid out. The following apply to all the aggregate and matrix types describing such an object, recursively through their nested types:
    - Each structure-type member must have an **Offset decoration**.
    - Each array type must have an **ArrayStride decoration**, unless it is an array that contains a structure decorated with **Block** or **BufferBlock**, in which case it must not have an **ArrayStride** decoration.
    - Each structure-type member that is a matrix or array-of-matrices must have be **decorated** with
      - \* a **MatrixStride Decoration**, and
      - \* one of the **RowMajor** or **ColMajor decorations**.
    - The **ArrayStride**, **MatrixStride**, and **Offset decorations** must be large enough to hold the size of the objects they affect (that is, specifying overlap is invalid). Each **ArrayStride** and **MatrixStride** must be greater than zero, and no two members of a given structure can be assigned to the same **Offset**.
    - Each **OpPtrAccessChain** must have a *Base* whose type is **decorated** with **ArrayStride**.
    - When an array-element pointer is derived from an array (e.g., using **OpAccessChain**), and the resulting element-pointer type is **decorated** with **ArrayStride**, its *Array Stride* must match the *Array Stride* of the array's type. If the array's type is not decorated with **ArrayStride**, the derived array-element pointer also cannot be decorated with **ArrayStride**.
  - For **structure** objects in the **Input** and **Output Storage Classes**, the following apply:
    - When applied to structure-type members, the **decorations Noperspective**, **Flat**, **Patch**, **Centroid**, and **Sample** can only be applied to the top-level members of the structure type. (Nested objects' types cannot be structures whose members are decorated with these decorations.)
  - **Type Rules**
    - All declared types are restricted to those types that are, or are contained within, valid types for an **OpVariable Result Type** or an **OpTypeFunction Return Type**.
    - Aggregate types for **intermediate objects** are restricted to those types that are valid types of an **OpVariable Result Type** in the global storage classes.
  - **Decorations**
    - At most one of **Noperspective** or **Flat decorations** can be applied to the same object or member.
    - At most one of **Patch**, **Centroid**, or **Sample decorations** can be applied to the same object or member.
    - At most one of **Block** and **BufferBlock decorations** can be applied to a structure type.

- **Block** and **BufferBlock** decorations cannot decorate a structure type that is nested at any level inside another structure type decorated with **Block** or **BufferBlock**.
- The **FPRoundingMode** decoration can be applied only to a width-only conversion instruction whose only uses are *Object* operands of **OpStore** instructions storing through a pointer to a 16-bit floating-point object in the **StorageBuffer**, **PhysicalStorageBuffer**, **Uniform**, or **Output Storage Classes**.
- All *<id>* used for **Scope** and **Memory Semantics** must be of an **OpConstant**.
- Atomic access rules
  - The pointers taken by atomic operation instructions are further restricted to not point into the **Function storage class**.

### 2.16.3 Validation Rules for Kernel Capabilities

- The *Signedness* in **OpTypeInt** must always be 0.

## 2.17 Universal Limits

These quantities are minimum limits for all implementations and validators. Implementations are allowed to support larger quantities. Client APIs may impose larger minimums. See [Language Capabilities](#).

Validators must either

- inform when these limits are crossed, or
- be explicitly parameterized with larger limits.

Table 3: Limits

Limited Entity	Minimum Limit	
	Decimal	Hexadecimal
Characters in a <a href="#">literal</a> string	65,535	FFFF
Result <i>&lt;id&gt;</i> bound	4,194,303	3FFFFFF
See <a href="#">Physical Layout</a> for the shader-specific bound.		
Control-flow nesting depth		
Measured per function, in program order, counting the maximum number of <a href="#">OpBranch</a> , <a href="#">OpBranchConditional</a> , or <a href="#">OpSwitch</a> that are seen without yet seeing their corresponding <i>Merge Block</i> , as declared by <a href="#">OpSelectionMerge</a> or <a href="#">OpLoopMerge</a> .	1023	3FF
Global variables ( <a href="#">Storage Class</a> other than <b>Function</b> )	65,535	FFFF
Local variables ( <b>Function</b> <a href="#">Storage Class</a> )	524,287	7FFFFFF
Decorations per target <i>&lt;id&gt;</i>	Number of entries in the <a href="#">Decoration</a> table.	
Execution modes per entry point	255	FF
Indexes for <a href="#">OpAccessChain</a> , <a href="#">OpInBoundsAccessChain</a> , <a href="#">OpPtrAccessChain</a> , <a href="#">OpInBoundsPtrAccessChain</a> , <a href="#">OpCompositeExtract</a> , and <a href="#">OpCompositeInsert</a>	255	FF
Number of function parameters, per function declaration	255	FF
<a href="#">OpFunctionCall</a> actual arguments	255	FF
<a href="#">OpExtInst</a> actual arguments	255	FF
<a href="#">OpSwitch</a> (literal, label) pairs	16,383	3FFF
<a href="#">OpTypeStruct</a> members	16,383	3FFF
Structure nesting depth	255	FF

## 2.18 Memory Model

A memory model is chosen using a single [OpMemoryModel](#) instruction near the beginning of the module. This selects both an addressing model and a memory model.

The **Logical addressing model** means pointers are abstract, having no physical size or numeric value. In this mode, pointers can only be created from existing objects, and they cannot be stored into an object, unless additional [capabilities](#), e.g., **VariablePointers**, are declared to add such functionality.

The non-**Logical addressing models** allow physical pointers to be formed. [OpVariable](#) can be used to create objects that hold pointers. These are declared for a specific [Storage Class](#). Pointers for one Storage Class cannot be used to access

objects in another Storage Class. However, they can be converted with conversion opcodes. Any particular addressing model must describe the bit width of pointers for each of the storage classes.

### 2.18.1 Memory Layout

When memory is shared between a SPIR-V module and its client API, its contents are transparent, and must be agreed on. For example, the **Offset**, **MatrixStride**, and **ArrayStride Decorations** can partially define how the memory is laid out. In addition, the following are always true, applied recursively as needed, of the offsets within the memory buffer:

- a vector consumes contiguous memory with lower-numbered components appearing in smaller offsets than higher-numbered components, and with component 0 starting at the vector's **Offset Decoration**, if present
- in an array, lower-numbered elements appear at smaller offsets than higher-numbered elements, with element 0 starting at the **Offset Decoration** for the array, if present
- in a matrix, lower-numbered columns appear at smaller offsets than higher-numbered columns, and lower-numbered components within the matrix's vectors appearing at smaller offsets than high-numbered components, with component 0 of column 0 starting at the **Offset Decoration**, if present (the **RowMajor** and **ColMajor Decorations** dictate what is contiguous)

### 2.18.2 Aliasing

Two **memory object declarations** are said to *alias* if they can be accessed (in bounds) such that both accesses address the same memory locations. If two memory operations access the same locations, and at least one of them performs a write, then those accesses must be ordered according to the memory consistency model specified by the client API.

How aliasing is managed depends on the **memory model**:

- The **Simple**, **GLSL**, and **Vulkan** memory models can assume that aliasing is generally not present between the **memory object declarations**. Specifically, the consumer is free to assume aliasing is not present between memory object declarations, unless the memory object declarations explicitly indicate they alias. Aliasing is indicated by applying the **Aliased decoration** to a memory object declaration's *<id>*, for **OpVariable** and **OpFunctionParameter**. Applying **Restrict** is allowed, but has no effect. For variables holding **PhysicalStorageBuffer** pointers, applying the **AliasedPointer** decoration on the **OpVariable** indicates that the **PhysicalStorageBuffer** pointers are potentially aliased. Applying **RestrictPointer** is allowed, but has no effect. Variables holding **PhysicalStorageBuffer** pointers must be decorated as either **AliasedPointer** or **RestrictPointer**. Only those **memory object declarations** decorated with **Aliased** or **AliasedPointer** may alias each other.
- The **OpenCL** memory model must, unless otherwise proven, assume that **memory object declarations** might alias each other. An implementation may assume that memory object declarations decorated with **Restrict** will not alias any other memory object declaration. Applying **Aliased** is allowed, but has no effect.

The **Aliased** decoration can be used to express that certain **memory object declarations** may alias. Referencing the following table, a memory object declaration *P* may alias another declared pointer *Q* if within a single row:

- *P* is an instruction with opcode and storage class from the first pair of columns, and
- *Q* is an instruction with opcode and storage class from the second pair of columns.

First Storage Class	First Instruction(s)	Second Instructions	Second Storage Classes
<b>CrossWorkgroup</b>	<b>OpFunctionParameter</b> , <b>OpVariable</b>	<b>OpFunctionParameter</b> , <b>OpVariable</b>	<b>CrossWorkgroup</b> , <b>Generic</b>
<b>Function</b>	<b>OpFunctionParameter</b>	<b>OpFunctionParameter</b> , <b>OpVariable</b>	<b>Function</b> , <b>Generic</b>
<b>Function</b>	<b>OpVariable</b>	<b>OpFunctionParameter</b>	<b>Function</b> , <b>Generic</b>

<b>Generic</b>	<b>OpFunctionParameter</b>	<b>OpFunctionParameter, OpVariable</b>	<b>CrossWorkgroup, Function, Generic, Workgroup</b>
<b>Image</b>	<b>OpFunctionParameter, OpVariable</b>	<b>OpFunctionParameter, OpVariable</b>	<b>Image, StorageBuffer, PhysicalStorageBuffer, Uniform, UniformConstant</b>
<b>Output</b>	<b>OpFunctionParameter</b>	<b>OpFunctionParameter, OpVariable</b>	<b>Output</b>
<b>Private</b>	<b>OpFunctionParameter</b>	<b>OpFunctionParameter, OpVariable</b>	<b>Private</b>
<b>StorageBuffer</b>	<b>OpFunctionParameter, OpVariable</b>	<b>OpFunctionParameter, OpVariable</b>	<b>Image, StorageBuffer, PhysicalStorageBuffer, Uniform, UniformConstant</b>
<b>PhysicalStorageBuffer</b>	<b>OpFunctionParameter, OpVariable</b>	<b>OpFunctionParameter, OpVariable</b>	<b>Image, StorageBuffer, PhysicalStorageBuffer, Uniform, UniformConstant</b>
<b>Uniform</b>	<b>OpFunctionParameter, OpVariable</b>	<b>OpFunctionParameter, OpVariable</b>	<b>Image, StorageBuffer, PhysicalStorageBuffer, Uniform, UniformConstant</b>
<b>UniformConstant</b>	<b>OpFunctionParameter, OpVariable</b>	<b>OpFunctionParameter, OpVariable</b>	<b>Image, StorageBuffer, PhysicalStorageBuffer, Uniform, UniformConstant</b>
<b>Workgroup</b>	<b>OpFunctionParameter</b>	<b>OpFunctionParameter, OpVariable</b>	<b>Workgroup, Generic</b>
<b>Workgroup</b>	<b>OpVariable</b>	<b>OpFunctionParameter</b>	<b>Workgroup, Generic</b>

In addition to the above table, [memory object declarations](#) in the **CrossWorkgroup**, **Function**, **Input**, **Output**, **Private**, or **Workgroup** storage classes must also have matching pointee types for aliasing to be present. In all other cases the decoration is ignored.

Because aliasing, as described above, only applies to [memory object declarations](#), a consumer cannot make any assumptions about whether or not memory regions of non memory object declarations overlap. As such, a consumer must perform dependency analysis on non memory object declarations if it wishes to reorder instructions affecting memory. Behavior is undefined when operations on two memory object declarations access the same memory location, with at least one of them performing a write, and at least one of the memory object declarations does not have the **Aliased** decoration.

For the **PhysicalStorageBuffer** [storage class](#), **OpVariable** is understood to mean the **PhysicalStorageBuffer** pointer value(s) stored in the variable. An **Aliased PhysicalStorageBuffer** pointer stored in a **Function** variable can potentially alias with other variables in the same function, global variables, or function parameters.

It is invalid to apply both **Restrict** and **Aliased** to the same *<id>*.

### 2.18.3 Null pointers

A "null pointer" can be formed from an **OpConstantNull** instruction with a pointer result type. The resulting pointer value is abstract, and will not equal the pointer value formed from any declared object or access chain into a declared object. Behavior is undefined when loading or storing through an **OpConstantNull** value.

## 2.19 Derivatives

Derivatives appear only in the **Fragment Execution Model**. They can be implicit or explicit. Some [image instructions](#) consume implicit derivatives, while the [derivative instructions](#) compute explicit derivatives. In all cases, derivatives are well defined only if the [derivative group](#) has [uniform control flow](#).

## 2.20 Code Motion

Texturing instructions in the **Fragment Execution Model** that rely on an implicit derivative cannot be moved into control flow that is not known to be [uniform control flow](#) within each [derivative group](#).

## 2.21 Deprecation

A feature may be marked as deprecated by a version of the specification or extension to the specification. Features marked as deprecated in one version of the specification are still present in that version, but future versions may reduce their support or completely remove them. Deprecating before removing allows applications time to transition away from the deprecated feature. Once the feature is removed, all tokens used exclusively by that feature will be reserved and any use of those tokens will become invalid.

## 2.22 Unified Specification

This document specifies all versions of **SPIR-V**.

There are three kinds of entries in the tables of enumerated tokens:

- **Reservation:** These say [Reserved](#) in the enabling capabilities. They often contain token names only, lacking a semantic description. They are invalid **SPIR-V** for any version, serving only to reserve the tokens. They may identify enabling capabilities and extensions, in which case any listed extensions might add the tokens. See the listed extensions for additional information.
- **Conditional:** These say [Missing before](#) or [Missing after](#) in the enabling capabilities. They are invalid **SPIR-V** for the missing versions. They may identify enabling capabilities and extensions, in which case any listed extensions might add the tokens for some of the missing versions. See the listed extensions for additional information. For versions not identified as missing, the tokens are valid **SPIR-V**, subject to any listed enabling capabilities.
- **Universal:** These have no mention of what version they are missing in, or of being reserved. They are valid in all versions of **SPIR-V**.

## 2.23 Uniformity

SPIR-V has multiple notions of uniformity of values. A *Result* [<id>](#) [decorated](#) as **Uniform** (for a particular scope) is a contract that all invocations within that scope will compute the same value for that result, for a given dynamic instance of an instruction. This is useful to enable implementations to store results in a scalar register file (*scalarization*), for example. Results are assumed not to be uniform unless decorated as such.

An [<id>](#) is defined to be [dynamically uniform](#) for a dynamic instance of an instruction if all invocations (in an invocation group) that execute the dynamic instance have the same value for that [<id>](#). This is not something that is explicitly decorated, it is just a property that arises. This property is assumed to hold for operands of certain instructions, such as the *Image* operand of image instructions, unless that operand is decorated as **NonUniform**. Some implementations require more complex instruction expansions to handle non-dynamically uniform values in certain instructions, and thus it is mandatory for certain operands to be decorated as **NonUniform** if they are not guaranteed to be dynamically uniform.

While the names may suggest otherwise, nothing forbids an [<id>](#) from being decorated as both **Uniform** and **NonUniform**. Because *dynamically uniform* is at a larger scope (invocation group) than the default **Uniform** scope (subgroup), it is even possible for the [<id>](#) to be uniform at the subgroup scope but not dynamically uniform.

## 3 Binary Form

This section contains the exact form for all instructions, starting with the numerical values for all fields. See [Physical Layout](#) for the order words appear in.

### 3.1 Magic Number

Magic number for a SPIR-V module.

---

**Tip**

**Endianness:** A module is defined as a stream of words, not a stream of bytes. However, if stored as a stream of bytes (e.g., in a file), the magic number can be used to deduce what endianness to apply to convert the byte stream back to a word stream.

---

Magic Number
0x07230203

### 3.2 Source Language

The source language is for debug purposes only, with no semantics that affect the meaning of other parts of the module. Used by [OpSource](#).

Source Language	
0	<b>Unknown</b>
1	<b>ESSL</b>
2	<b>GLSL</b>
3	<b>OpenCL_C</b>
4	<b>OpenCL_CPP</b>
5	<b>HLSL</b>

### 3.3 Execution Model

Used by [OpEntryPoint](#).

Execution Model		Enabling Capabilities
0	<b>Vertex</b> Vertex shading stage.	<b>Shader</b>
1	<b>TessellationControl</b> Tessellation control (or hull) shading stage.	<b>Tessellation</b>
2	<b>TessellationEvaluation</b> Tessellation evaluation (or domain) shading stage.	<b>Tessellation</b>
3	<b>Geometry</b> Geometry shading stage.	<b>Geometry</b>
4	<b>Fragment</b> Fragment shading stage.	<b>Shader</b>
5	<b>GLCompute</b> Graphical compute shading stage.	<b>Shader</b>
6	<b>Kernel</b> Compute kernel.	<b>Kernel</b>

Execution Model		Enabling Capabilities
5267	<b>TaskNV</b>	MeshShadingNV  Reserved.
5268	<b>MeshNV</b>	MeshShadingNV  Reserved.
5313	<b>RayGenerationNV</b>	RayTracingNV  Reserved.
5314	<b>IntersectionNV</b>	RayTracingNV  Reserved.
5315	<b>AnyHitNV</b>	RayTracingNV  Reserved.
5316	<b>ClosestHitNV</b>	RayTracingNV  Reserved.
5317	<b>MissNV</b>	RayTracingNV  Reserved.
5318	<b>CallableNV</b>	RayTracingNV  Reserved.

### 3.4 Addressing Model

Used by [OpMemoryModel](#).

Addressing Model		Enabling Capabilities
0	<b>Logical</b>	
1	<b>Physical32</b> Indicates a 32-bit module, where the address width is equal to 32 bits.	Addresses
2	<b>Physical64</b> Indicates a 64-bit module, where the address width is equal to 64 bits.	Addresses
5348	<b>PhysicalStorageBuffer64</b> Indicates that pointers with a <a href="#">storage class</a> of <b>PhysicalStorageBuffer</b> are physical pointer types with an address width of 64 bits, while pointers to all other storage classes are logical.	PhysicalStorageBufferAddresses  Missing before version 1.5.  Also see extensions: <b>SPV_EXT_physical_storage_buffer</b> , <b>SPV_KHR_physical_storage_buffer</b>
5348	<b>PhysicalStorageBuffer64EXT</b>	PhysicalStorageBufferAddresses  Missing before version 1.5.  Also see extension: <b>SPV_EXT_physical_storage_buffer</b>

### 3.5 Memory Model

Used by [OpMemoryModel](#).

Memory Model		Enabling Capabilities
0	<b>Simple</b> No shared memory consistency issues.	<b>Shader</b>
1	<b>GLSL450</b> Memory model needed by later versions of GLSL and ESSL. Works across multiple versions.	<b>Shader</b>
2	<b>OpenCL</b> OpenCL memory model.	<b>Kernel</b>
3	<b>Vulkan</b> <b>Vulkan memory model</b> , as specified by the client API. This memory model must be declared if and only if the <b>VulkanMemoryModel</b> <a href="#">capability</a> is declared.	<b>VulkanMemoryModel</b>  <a href="#">Missing before version 1.5.</a>
3	<b>VulkanKHR</b>	<b>VulkanMemoryModel</b>  <a href="#">Missing before version 1.5.</a>  Also see extension: <b>SPV_KHR_vulkan_memory_model</b>

### 3.6 Execution Mode

Declare the modes an [entry point](#) will execute in. Used by [OpExecutionMode](#) and [OpExecutionModeId](#).

Execution Mode		Extra Operands	Enabling Capabilities
0	<b>Invocations</b> <i>Number of invocations</i> is an unsigned 32-bit integer number of times to invoke the geometry stage for each input primitive received. The default is to run once for each input primitive. It is invalid to specify a value greater than the target-dependent maximum. Only valid with the <b>Geometry</b> <a href="#">Execution Model</a> .	<a href="#">Literal</a> <i>Number of <a href="#">invocations</a></i>	<b>Geometry</b>
1	<b>SpacingEqual</b> Requests the tessellation primitive generator to divide edges into a collection of equal-sized segments. Only valid with one of the tessellation <a href="#">Execution Models</a> .		<b>Tessellation</b>
2	<b>SpacingFractionalEven</b> Requests the tessellation primitive generator to divide edges into an even number of equal-length segments plus two additional shorter fractional segments. Only valid with one of the tessellation <a href="#">Execution Models</a> .		<b>Tessellation</b>

Execution Mode		Extra Operands	Enabling Capabilities
3	<b>SpacingFractionalOdd</b> Requests the tessellation primitive generator to divide edges into an odd number of equal-length segments plus two additional shorter fractional segments. Only valid with one of the tessellation <a href="#">Execution Models</a> .		Tessellation
4	<b>VertexOrderCw</b> Requests the tessellation primitive generator to generate triangles in clockwise order. Only valid with one of the tessellation <a href="#">Execution Models</a> .		Tessellation
5	<b>VertexOrderCcw</b> Requests the tessellation primitive generator to generate triangles in counter-clockwise order. Only valid with one of the tessellation <a href="#">Execution Models</a> .		Tessellation
6	<b>PixelCenterInteger</b> Pixels appear centered on whole-number pixel offsets. E.g., the coordinate (0.5, 0.5) appears to move to (0.0, 0.0). Only valid with the <b>Fragment Execution Model</b> . If a <b>Fragment</b> entry point does not have this set, pixels appear centered at offsets of (0.5, 0.5) from whole numbers		Shader
7	<b>OriginUpperLeft</b> The coordinates decorated by <b>FragCoord</b> appear to originate in the upper left, and increase toward the right and downward. Only valid with the <b>Fragment Execution Model</b> .		Shader
8	<b>OriginLowerLeft</b> The coordinates decorated by <b>FragCoord</b> appear to originate in the lower left, and increase toward the right and upward. Only valid with the <b>Fragment Execution Model</b> .		Shader
9	<b>EarlyFragmentTests</b> Fragment tests are to be performed before fragment shader execution. Only valid with the <b>Fragment Execution Model</b> .		Shader
10	<b>PointMode</b> Requests the tessellation primitive generator to generate a point for each distinct vertex in the subdivided primitive, rather than to generate lines or triangles. Only valid with one of the tessellation <a href="#">Execution Models</a> .		Tessellation

Execution Mode		Extra Operands			Enabling Capabilities
11	<b>Xfb</b> This stage will run in transform feedback-capturing mode and this module is responsible for describing the transform-feedback setup. See the <b>XfbBuffer</b> , <b>Offset</b> , and <b>XfbStride Decorations</b> .				<b>TransformFeedback</b>
12	<b>DepthReplacing</b> This mode must be declared if and only if this entry point dynamically writes the <b>FragDepth</b> -decorated variable. Only valid with the <b>Fragment Execution Model</b> .				<b>Shader</b>
14	<b>DepthGreater</b> Indicates that per-fragment tests may assume that any <b>FragDepth built in</b> -decorated value written by the shader will be greater-than-or-equal to the fragment's interpolated depth value (given by the <i>z</i> component of the <b>FragCoord built in</b> -decorated variable). Other stages of the pipeline use the written value as normal. Only valid with the <b>Fragment execution model</b> .				<b>Shader</b>
15	<b>DepthLess</b> Indicates that per-fragment tests may assume that any <b>FragDepth built in</b> -decorated value written by the shader will be less than the fragment's interpolated depth value (given by the <i>z</i> component of the <b>FragCoord built in</b> -decorated variable). Other stages of the pipeline use the written value as normal. Only valid with the <b>Fragment execution model</b> .				<b>Shader</b>
16	<b>DepthUnchanged</b> Indicates that per-fragment tests may assume that any <b>FragDepth built in</b> -decorated value written by the shader will be the same as the fragment's interpolated depth value (given by the <i>z</i> component of the <b>FragCoord built in</b> -decorated variable). Other stages of the pipeline use the written value as normal. Only valid with the <b>Fragment execution model</b> .				<b>Shader</b>
17	<b>LocalSize</b> Indicates the work-group size in the <i>x</i> , <i>y</i> , and <i>z</i> dimensions. <i>x size</i> , <i>y size</i> , and <i>z size</i> are unsigned 32-bit integers. Only valid with the <b>GLCompute</b> or <b>Kernel Execution Models</b> .	<b>Literal</b> <i>x size</i>	<b>Literal</b> <i>y size</i>	<b>Literal</b> <i>z size</i>	

Execution Mode		Extra Operands			Enabling Capabilities
18	<b>LocalSizeHint</b> A hint to the compiler, which indicates the most likely to be used work-group size in the <i>x</i> , <i>y</i> , and <i>z</i> dimensions. <i>x size</i> , <i>y size</i> , and <i>z size</i> are unsigned 32-bit integers. Only valid with the <b>Kernel Execution Model</b> .	<a href="#">Literal</a> <i>x size</i>	<a href="#">Literal</a> <i>y size</i>	<a href="#">Literal</a> <i>z size</i>	<b>Kernel</b>
19	<b>InputPoints</b> Stage input primitive is <i>points</i> . Only valid with the <b>Geometry Execution Model</b> .				<b>Geometry</b>
20	<b>InputLines</b> Stage input primitive is <i>lines</i> . Only valid with the <b>Geometry Execution Model</b> .				<b>Geometry</b>
21	<b>InputLinesAdjacency</b> Stage input primitive is <i>lines adjacency</i> . Only valid with the <b>Geometry Execution Model</b> .				<b>Geometry</b>
22	<b>Triangles</b> For a geometry stage, input primitive is <i>triangles</i> . For a tessellation stage, requests the tessellation primitive generator to generate triangles. Only valid with the <b>Geometry</b> or one of the tessellation <b>Execution Models</b> .				<b>Geometry, Tessellation</b>
23	<b>InputTrianglesAdjacency</b> Geometry stage input primitive is <i>triangles adjacency</i> . Only valid with the <b>Geometry Execution Model</b> .				<b>Geometry</b>
24	<b>Quads</b> Requests the tessellation primitive generator to generate <i>quads</i> . Only valid with one of the tessellation <b>Execution Models</b> .				<b>Tessellation</b>
25	<b>Isolines</b> Requests the tessellation primitive generator to generate <i>isolines</i> . Only valid with one of the tessellation <b>Execution Models</b> .				<b>Tessellation</b>
26	<b>OutputVertices</b> <i>Vertex Count</i> is an unsigned 32-bit integer. For a geometry stage, it is the maximum number of vertices the shader will ever emit in a single <b>invocation</b> . For a tessellation-control stage, it is the number of vertices in the output patch produced by the tessellation control shader, which also specifies the number of times the tessellation control shader is invoked. Only valid with the <b>Geometry</b> or one of the tessellation <b>Execution Models</b> .	<a href="#">Literal</a> <i>Vertex count</i>			<b>Geometry, Tessellation, MeshShadingNV</b>

	Execution Mode	Extra Operands	Enabling Capabilities
27	<b>OutputPoints</b> Stage output primitive is <i>points</i> . Only valid with the <b>Geometry Execution Model</b> .		<b>Geometry, MeshShadingNV</b>
28	<b>OutputLineStrip</b> Stage output primitive is <i>line strip</i> . Only valid with the <b>Geometry Execution Model</b> .		<b>Geometry</b>
29	<b>OutputTriangleStrip</b> Stage output primitive is <i>triangle strip</i> . Only valid with the <b>Geometry Execution Model</b> .		<b>Geometry</b>
30	<b>VecTypeHint</b> A hint to the compiler, which indicates that most operations used in the entry point are explicitly vectorized using a particular vector type. The 16 high-order bits of the <i>Vector Type</i> operand specify the <i>number of components</i> of the vector. The 16 low-order bits of the <i>Vector Type</i> operand specify the <i>data type</i> of the vector.  These are the legal <i>data type</i> values: <i>0</i> represents an 8-bit integer value. <i>1</i> represents a 16-bit integer value. <i>2</i> represents a 32-bit integer value. <i>3</i> represents a 64-bit integer value. <i>4</i> represents a 16-bit float value. <i>5</i> represents a 32-bit float value. <i>6</i> represents a 64-bit float value.  Only valid with the <b>Kernel Execution Model</b> .	<b>Literal</b> <i>Vector type</i>	<b>Kernel</b>
31	<b>ContractionOff</b> Indicates that floating-point-expressions contraction is disallowed. Only valid with the <b>Kernel Execution Model</b> .		<b>Kernel</b>
33	<b>Initializer</b> Indicates that this entry point is a module initializer.		<b>Kernel</b>  <b>Missing before version 1.1.</b>
34	<b>Finalizer</b> Indicates that this entry point is a module finalizer.		<b>Kernel</b>  <b>Missing before version 1.1.</b>
35	<b>SubgroupSize</b> Indicates that this entry point requires the specified <i>Subgroup Size</i> . <i>Subgroup Size</i> is an unsigned 32-bit integer.	<b>Literal</b> <i>Subgroup Size</i>	<b>SubgroupDispatch</b>  <b>Missing before version 1.1.</b>
36	<b>SubgroupsPerWorkgroup</b> Indicates that this entry point requires the specified number of <i>Subgroups Per Workgroup</i> . <i>Subgroups Per Workgroup</i> is an unsigned 32-bit integer.	<b>Literal</b> <i>Subgroups Per Workgroup</i>	<b>SubgroupDispatch</b>  <b>Missing before version 1.1.</b>

Execution Mode		Extra Operands			Enabling Capabilities
37	<b>SubgroupsPerWorkgroupId</b> Same as the <b>SubgroupsPerWorkgroup mode</b> , but using an <i>&lt;id&gt;</i> operand instead of a literal. The operand is consumed as unsigned and must be an <i>integer type</i> scalar.	<i>&lt;id&gt;</i> <i>Subgroups Per Workgroup</i>			<b>SubgroupDispatch</b>  Missing before version 1.2.
38	<b>LocalSizeId</b> Same as the <b>LocalSize Mode</b> , but using <i>&lt;id&gt;</i> operands instead of literals. The operands are consumed as unsigned and each must be an <i>integer type</i> scalar.	<i>&lt;id&gt;</i> <i>x size</i>	<i>&lt;id&gt;</i> <i>y size</i>	<i>&lt;id&gt;</i> <i>z size</i>	Missing before version 1.2.
39	<b>LocalSizeHintId</b> Same as the <b>LocalSizeHint Mode</b> , but using <i>&lt;id&gt;</i> operands instead of literals. The operands are consumed as unsigned and each must be an <i>integer type</i> scalar.	<i>&lt;id&gt;</i> <i>Local Size Hint</i>			<b>Kernel</b>  Missing before version 1.2.
4446	<b>PostDepthCoverage</b>				<b>SampleMaskPostDepthCoverage</b>  Reserved.  Also see extension: <b>SPV_KHR_post_depth_coverage</b>
4459	<b>DenormPreserve</b> Any denormalized value input into a shader or potentially generated by any instruction in a shader must be preserved. Denormalized values obtained via unpacking an integer into a vector of values with smaller bit width and interpreting those values as floating-point numbers must be preserved.  Only affects instructions operating on a floating-point type whose component width is <i>Target Width</i> . <i>Target Width</i> is an unsigned 32-bit integer.	<i>Literal</i> <i>Target Width</i>			<b>DenormPreserve</b>  Missing before version 1.4.  Also see extension: <b>SPV_KHR_float_controls</b>
4460	<b>DenormFlushToZero</b> Any denormalized value input into a shader or potentially generated by any instruction in a shader must be flushed to zero. Denormalized values obtained via unpacking an integer into a vector of values with smaller bit width and interpreting those values as floating-point numbers must be flushed to zero.  Only affects instructions operating on a floating-point type whose component width is <i>Target Width</i> . <i>Target Width</i> is an unsigned 32-bit integer.	<i>Literal</i> <i>Target Width</i>			<b>DenormFlushToZero</b>  Missing before version 1.4.  Also see extension: <b>SPV_KHR_float_controls</b>

	Execution Mode	Extra Operands	Enabling Capabilities
4461	<b>SignedZeroInfNanPreserve</b> The implementation must not perform optimizations on floating-point instructions that do not preserve sign of a zero, or assume that operands and results are not NaNs or infinities. Bit patterns for NaNs might not be preserved.  Only affects instructions operating on a floating-point type whose component width is <i>Target Width</i> . <i>Target Width</i> is an unsigned 32-bit integer.	<b>Literal</b> <i>Target Width</i>	<b>SignedZeroInfNanPreserve</b>  <b>Missing before version 1.4.</b>  Also see extension: <b>SPV_KHR_float_controls</b>
4462	<b>RoundingModeRTE</b> The default rounding mode for floating-point arithmetic and conversions instructions must be round to nearest even. If an instruction is decorated with <b>FPRoundingMode</b> or defines a rounding mode in its description, that rounding mode is applied and <b>RoundingModeRTE</b> is ignored.  Only affects instructions operating on a floating-point type whose component width is <i>Target Width</i> . <i>Target Width</i> is an unsigned 32-bit integer.	<b>Literal</b> <i>Target Width</i>	<b>RoundingModeRTE</b>  <b>Missing before version 1.4.</b>  Also see extension: <b>SPV_KHR_float_controls</b>
4463	<b>RoundingModeRTZ</b> The default rounding mode for floating-point arithmetic and conversions instructions must be round toward zero. If an instruction is decorated with <b>FPRoundingMode</b> or defines a rounding mode in its description, that rounding mode is applied and <b>RoundingModeRTZ</b> is ignored.  Only affects instructions operating on a floating-point type whose component width is <i>Target Width</i> . <i>Target Width</i> is an unsigned 32-bit integer.	<b>Literal</b> <i>Target Width</i>	<b>RoundingModeRTZ</b>  <b>Missing before version 1.4.</b>  Also see extension: <b>SPV_KHR_float_controls</b>
5027	<b>StencilRefReplacingEXT</b>		<b>StencilExportEXT</b>  <b>Reserved.</b>  Also see extension: <b>SPV_EXT_shader_stencil_export</b>
5269	<b>OutputLinesNV</b>		<b>MeshShadingNV</b>  <b>Reserved.</b>  Also see extension: <b>SPV_NV_mesh_shader</b>

	Execution Mode	Extra Operands	Enabling Capabilities

### 3.7 Storage Class

Class of storage for declared variables. [Intermediate values](#) do not form a storage class, and unless stated otherwise, storage class-based restrictions are not restrictions on intermediate objects and their types. Used by:

- [OpTypePointer](#)
- [OpTypeForwardPointer](#)
- [OpVariable](#)
- [OpGenericCastToPtrExplicit](#)

Storage Class		Enabling Capabilities
0	<b>UniformConstant</b> Shared externally, visible across all functions in all <a href="#">invocations</a> in all work groups. Graphics uniform memory. OpenCL constant memory. Variables declared with this storage class are read-only. They may have initializers, as allowed by the client API.	
1	<b>Input</b> Input from pipeline. Visible across all functions in the current <a href="#">invocation</a> . Variables declared with this storage class are read-only, and cannot have initializers.	
2	<b>Uniform</b> Shared externally, visible across all functions in all <a href="#">invocations</a> in all work groups. Graphics uniform blocks and buffer blocks.	<b>Shader</b>
3	<b>Output</b> Output to pipeline. Visible across all functions in the current <a href="#">invocation</a> .	<b>Shader</b>
4	<b>Workgroup</b> Shared across all <a href="#">invocations</a> within a work group. Visible across all functions. The OpenGL "shared" storage qualifier. OpenCL local memory.	
5	<b>CrossWorkgroup</b> Visible across all functions of all <a href="#">invocations</a> of all work groups. OpenCL global memory.	
6	<b>Private</b> Visible to all functions in the current <a href="#">invocation</a> . Regular global memory.	<b>Shader</b>
7	<b>Function</b> Visible only within the declaring function of the current <a href="#">invocation</a> . Regular function memory.	
8	<b>Generic</b> For generic pointers, which overload the <b>Function</b> , <b>Workgroup</b> , and <b>CrossWorkgroup Storage Classes</b> .	<b>GenericPointer</b>

Storage Class		Enabling Capabilities
9	<b>PushConstant</b> For holding push-constant memory, visible across all functions in all <a href="#">invocations</a> in all work groups. Intended to contain a small bank of values pushed from the client API. Variables declared with this storage class are read-only, and cannot have initializers.	<b>Shader</b>
10	<b>AtomicCounter</b> For holding atomic counters. Visible across all functions of the current <a href="#">invocation</a> . Atomic counter-specific memory.	<b>AtomicStorage</b>
11	<b>Image</b> For holding <a href="#">image</a> memory.	
12	<b>StorageBuffer</b> Shared externally, readable and writable, visible across all functions in all invocations in all work groups. Graphics storage buffers (buffer blocks).	<b>Shader</b>  <a href="#">Missing before version 1.3.</a>  Also see extensions: <b>SPV_KHR_storage_buffer_storage_class</b> , <b>SPV_KHR_variable_pointers</b>
5328	<b>CallableDataNV</b>	<b>RayTracingNV</b>  <a href="#">Reserved.</a>  Also see extension: <b>SPV_NV_ray_tracing</b>
5329	<b>IncomingCallableDataNV</b>	<b>RayTracingNV</b>  <a href="#">Reserved.</a>  Also see extension: <b>SPV_NV_ray_tracing</b>
5338	<b>RayPayloadNV</b>	<b>RayTracingNV</b>  <a href="#">Reserved.</a>  Also see extension: <b>SPV_NV_ray_tracing</b>
5339	<b>HitAttributeNV</b>	<b>RayTracingNV</b>  <a href="#">Reserved.</a>  Also see extension: <b>SPV_NV_ray_tracing</b>
5342	<b>IncomingRayPayloadNV</b>	<b>RayTracingNV</b>  <a href="#">Reserved.</a>  Also see extension: <b>SPV_NV_ray_tracing</b>
5343	<b>ShaderRecordBufferNV</b>	<b>RayTracingNV</b>  <a href="#">Reserved.</a>  Also see extension: <b>SPV_NV_ray_tracing</b>

Storage Class		Enabling Capabilities
5349	<b>PhysicalStorageBuffer</b> Shared externally, readable and writable, visible across all functions in all invocations in all work groups. Graphics storage buffers using physical addressing.	<b>PhysicalStorageBufferAddresses</b>  Missing before version 1.5.  Also see extensions: <b>SPV_EXT_physical_storage_buffer</b> , <b>SPV_KHR_physical_storage_buffer</b>
5349	<b>PhysicalStorageBufferEXT</b>	<b>PhysicalStorageBufferAddresses</b>  Missing before version 1.5.  Also see extension: <b>SPV_EXT_physical_storage_buffer</b>

### 3.8 Dim

Dimensionality of an image. The listed **Array** capabilities are required if the type's *Arrayed* operand is 1. The listed **Image** capabilities are required if the type's *Sampled* operand is 2. Used by [OpTypeImage](#).

Dim		Enabling Capabilities
0	<b>1D</b>	<b>Sampled1D, Image1D</b>
1	<b>2D</b>	<b>Shader, Kernel, ImageMSArray</b>
2	<b>3D</b>	
3	<b>Cube</b>	<b>Shader, ImageCubeArray</b>
4	<b>Rect</b>	<b>SampledRect, ImageRect</b>
5	<b>Buffer</b>	<b>SampledBuffer, ImageBuffer</b>
6	<b>SubpassData</b>	<b>InputAttachment</b>

### 3.9 Sampler Addressing Mode

Addressing mode for creating constant samplers. Used by [OpConstantSampler](#).

Sampler Addressing Mode		Enabling Capabilities
0	<b>None</b> The image coordinates used to sample elements of the image refer to a location inside the image, otherwise the results are undefined.	<b>Kernel</b>
1	<b>ClampToEdge</b> Out-of-range image coordinates are clamped to the extent.	<b>Kernel</b>
2	<b>Clamp</b> Out-of-range image coordinates will return a border color.	<b>Kernel</b>
3	<b>Repeat</b> Out-of-range image coordinates are wrapped to the valid range. Can only be used with normalized coordinates.	<b>Kernel</b>
4	<b>RepeatMirrored</b> Flip the image coordinate at every integer junction. Can only be used with normalized coordinates.	<b>Kernel</b>

### 3.10 Sampler Filter Mode

Filter mode for creating constant samplers. Used by [OpConstantSampler](#).

Sampler Filter Mode		Enabling Capabilities
0	<b>Nearest</b> Use filter nearest mode when performing a read image operation.	Kernel
1	<b>Linear</b> Use filter linear mode when performing a read image operation.	Kernel

### 3.11 Image Format

Declarative image format. Used by [OpTypeImage](#).

Image Format		Enabling Capabilities
0	<b>Unknown</b>	
1	<b>Rgba32f</b>	Shader
2	<b>Rgba16f</b>	Shader
3	<b>R32f</b>	Shader
4	<b>Rgba8</b>	Shader
5	<b>Rgba8Snorm</b>	Shader
6	<b>Rg32f</b>	StorageImageExtendedFormats
7	<b>Rg16f</b>	StorageImageExtendedFormats
8	<b>R11fG11fB10f</b>	StorageImageExtendedFormats
9	<b>R16f</b>	StorageImageExtendedFormats
10	<b>Rgba16</b>	StorageImageExtendedFormats
11	<b>Rgb10A2</b>	StorageImageExtendedFormats
12	<b>Rg16</b>	StorageImageExtendedFormats
13	<b>Rg8</b>	StorageImageExtendedFormats
14	<b>R16</b>	StorageImageExtendedFormats
15	<b>R8</b>	StorageImageExtendedFormats
16	<b>Rgba16Snorm</b>	StorageImageExtendedFormats
17	<b>Rg16Snorm</b>	StorageImageExtendedFormats
18	<b>Rg8Snorm</b>	StorageImageExtendedFormats
19	<b>R16Snorm</b>	StorageImageExtendedFormats
20	<b>R8Snorm</b>	StorageImageExtendedFormats
21	<b>Rgba32i</b>	Shader
22	<b>Rgba16i</b>	Shader
23	<b>Rgba8i</b>	Shader
24	<b>R32i</b>	Shader
25	<b>Rg32i</b>	StorageImageExtendedFormats
26	<b>Rg16i</b>	StorageImageExtendedFormats
27	<b>Rg8i</b>	StorageImageExtendedFormats
28	<b>R16i</b>	StorageImageExtendedFormats
29	<b>R8i</b>	StorageImageExtendedFormats
30	<b>Rgba32ui</b>	Shader
31	<b>Rgba16ui</b>	Shader
32	<b>Rgba8ui</b>	Shader
33	<b>R32ui</b>	Shader
34	<b>Rgb10a2ui</b>	StorageImageExtendedFormats
35	<b>Rg32ui</b>	StorageImageExtendedFormats
36	<b>Rg16ui</b>	StorageImageExtendedFormats

Image Format		Enabling Capabilities
37	<b>Rg8ui</b>	StorageImageExtendedFormats
38	<b>R16ui</b>	StorageImageExtendedFormats
39	<b>R8ui</b>	StorageImageExtendedFormats

### 3.12 Image Channel Order

Image channel order returned by [OpImageQueryOrder](#).

Image Channel Order		Enabling Capabilities
0	<b>R</b>	Kernel
1	<b>A</b>	Kernel
2	<b>RG</b>	Kernel
3	<b>RA</b>	Kernel
4	<b>RGB</b>	Kernel
5	<b>RGBA</b>	Kernel
6	<b>BGRA</b>	Kernel
7	<b>ARGB</b>	Kernel
8	<b>Intensity</b>	Kernel
9	<b>Luminance</b>	Kernel
10	<b>Rx</b>	Kernel
11	<b>RGx</b>	Kernel
12	<b>RGBx</b>	Kernel
13	<b>Depth</b>	Kernel
14	<b>DepthStencil</b>	Kernel
15	<b>sRGB</b>	Kernel
16	<b>sRGBx</b>	Kernel
17	<b>sRGBA</b>	Kernel
18	<b>sBGRA</b>	Kernel
19	<b>ABGR</b>	Kernel

### 3.13 Image Channel Data Type

Image channel data type returned by [OpImageQueryFormat](#).

Image Channel Data Type		Enabling Capabilities
0	<b>SnormInt8</b>	Kernel
1	<b>SnormInt16</b>	Kernel
2	<b>UnormInt8</b>	Kernel
3	<b>UnormInt16</b>	Kernel
4	<b>UnormShort565</b>	Kernel
5	<b>UnormShort555</b>	Kernel
6	<b>UnormInt101010</b>	Kernel
7	<b>SignedInt8</b>	Kernel
8	<b>SignedInt16</b>	Kernel
9	<b>SignedInt32</b>	Kernel
10	<b>UnsignedInt8</b>	Kernel
11	<b>UnsignedInt16</b>	Kernel
12	<b>UnsignedInt32</b>	Kernel
13	<b>HalfFloat</b>	Kernel
14	<b>Float</b>	Kernel
15	<b>UnormInt24</b>	Kernel
16	<b>UnormInt101010_2</b>	Kernel

### 3.14 Image Operands

Additional operands to sampling, or getting texels from, an image. Bits that are set can indicate whether an additional operand follows, as described by the table. If there are multiple following operands indicated, they are ordered: Those indicated by smaller-numbered bits appear first. At least one bit must be set (**None** is invalid).

This value is a literal mask; it can be formed by combining the bits from multiple rows in the table below.

Used by:

- [OpImageSampleImplicitLod](#)
- [OpImageSampleExplicitLod](#)
- [OpImageSampleDrefImplicitLod](#)
- [OpImageSampleDrefExplicitLod](#)
- [OpImageSampleProjImplicitLod](#)
- [OpImageSampleProjExplicitLod](#)
- [OpImageSampleProjDrefImplicitLod](#)
- [OpImageSampleProjDrefExplicitLod](#)
- [OpImageFetch](#)
- [OpImageGather](#)
- [OpImageDrefGather](#)
- [OpImageRead](#)
- [OpImageWrite](#)
- [OpImageSparseSampleImplicitLod](#)
- [OpImageSparseSampleExplicitLod](#)
- [OpImageSparseSampleDrefImplicitLod](#)
- [OpImageSparseSampleDrefExplicitLod](#)
- [OpImageSparseSampleProjImplicitLod](#)
- [OpImageSparseSampleProjExplicitLod](#)
- [OpImageSparseSampleProjDrefImplicitLod](#)
- [OpImageSparseSampleProjDrefExplicitLod](#)
- [OpImageSparseFetch](#)
- [OpImageSparseGather](#)
- [OpImageSparseDrefGather](#)
- [OpImageSparseRead](#)
- [OpImageSampleFootprintNV](#)

Image Operands		Enabling Capabilities
0x0	<b>None</b>	
0x1	<b>Bias</b> A following operand is the bias added to the implicit level of detail. Only valid with implicit-lod instructions. It must be a <a href="#">floating-point type</a> scalar. This can only be used with an <a href="#">OpTypeImage</a> that has a <a href="#">Dim</a> operand of <b>1D</b> , <b>2D</b> , <b>3D</b> , or <b>Cube</b> , and the <i>MS</i> operand must be 0.	<b>Shader</b>

Image Operands		Enabling Capabilities
0x2	<b>Lod</b> A following operand is the explicit level-of-detail to use. Only valid with explicit-lod instructions. For sampling operations, it must be a <a href="#">floating-point type</a> scalar. For fetch operations, it must be an <a href="#">integer type</a> scalar. This can only be used with an <a href="#">OpTypeImage</a> that has a <a href="#">Dim</a> operand of <b>1D</b> , <b>2D</b> , <b>3D</b> , or <b>Cube</b> , and the <i>MS</i> operand must be 0.	
0x4	<b>Grad</b> Two following operands are <i>dx</i> followed by <i>dy</i> . These are explicit derivatives in the <i>x</i> and <i>y</i> direction to use in computing level of detail. Each is a scalar or vector containing ( <i>du/dx</i> [, <i>dv/dx</i> [, <i>dw/dx</i> ]) and ( <i>du/dy</i> [, <i>dv/dy</i> [, <i>dw/dy</i> ]). The number of components of each must equal the number of components in <i>Coordinate</i> , minus the <i>array layer</i> component, if present. Only valid with explicit-lod instructions. They must be a scalar or vector of <a href="#">floating-point type</a> . This can only be used with an <a href="#">OpTypeImage</a> that has an <i>MS</i> operand of 0. It is invalid to set both the <b>Lod</b> and <b>Grad</b> bits.	
0x8	<b>ConstOffset</b> A following operand is added to ( <i>u</i> , <i>v</i> , <i>w</i> ) before texel lookup. It must be an <i>&lt;id&gt;</i> of an integer-based <a href="#">constant instruction</a> of scalar or vector type. It is invalid for these to be outside a target-dependent allowed range. The number of components must equal the number of components in <i>Coordinate</i> , minus the <i>array layer</i> component, if present. Not valid with the <b>Cube dimension</b> . At most one of the <b>ConstOffset</b> , <b>Offset</b> , and <b>ConstOffsets</b> image operands can be used on a given instruction.	
0x10	<b>Offset</b> A following operand is added to ( <i>u</i> , <i>v</i> , <i>w</i> ) before texel lookup. It must be a scalar or vector of <a href="#">integer type</a> . It is invalid for these to be outside a target-dependent allowed range. The number of components must equal the number of components in <i>Coordinate</i> , minus the <i>array layer</i> component, if present. Not valid with the <b>Cube dimension</b> . At most one of the <b>ConstOffset</b> , <b>Offset</b> , and <b>ConstOffsets</b> image operands can be used on a given instruction.	ImageGatherExtended
0x20	<b>ConstOffsets</b> A following operand is <i>Offsets</i> . <i>Offsets</i> must be an <i>&lt;id&gt;</i> of a <a href="#">constant instruction</a> making an array of size four of vectors of two integer components. Each gathered texel is identified by adding one of these array elements to the ( <i>u</i> , <i>v</i> ) sampled location. It is invalid for these to be outside a target-dependent allowed range. Only valid with <a href="#">OpImageGather</a> or <a href="#">OpImageDrefGather</a> . Not valid with the <b>Cube dimension</b> . At most one of the <b>ConstOffset</b> , <b>Offset</b> , and <b>ConstOffsets</b> image operands can be used on a given instruction.	ImageGatherExtended

Image Operands		Enabling Capabilities
0x40	<b>Sample</b> A following operand is the sample number of the sample to use. Only valid with <a href="#">OpImageFetch</a> , <a href="#">OpImageRead</a> , <a href="#">OpImageWrite</a> , <a href="#">OpImageSparseFetch</a> , and <a href="#">OpImageSparseRead</a> . It is invalid to have a <b>Sample</b> operand if the underlying <a href="#">OpTypeImage</a> has <i>MS</i> of 0. It must be an <a href="#">integer type</a> scalar.	
0x80	<b>MinLod</b> A following operand is the minimum level-of-detail to use when accessing the image. Only valid with <b>Implicit</b> instructions and <b>Grad</b> instructions. It must be a <a href="#">floating-point type</a> scalar. This can only be used with an <a href="#">OpTypeImage</a> that has a <a href="#">Dim</a> operand of <b>1D</b> , <b>2D</b> , <b>3D</b> , or <b>Cube</b> , and the <i>MS</i> operand must be 0.	<b>MinLod</b>
0x100	<b>MakeTexelAvailable</b> Perform an availability operation on the texel locations after the store. A following operand is the <a href="#">scope</a> that controls the availability operation. Requires <b>NonPrivateTexel</b> to also be set. Only valid with <a href="#">OpImageWrite</a> .	<b>VulkanMemoryModel</b>  Missing before version 1.5.
0x100	<b>MakeTexelAvailableKHR</b>	<b>VulkanMemoryModel</b>  Missing before version 1.5.  Also see extension: <b>SPV_KHR_vulkan_memory_model</b>
0x200	<b>MakeTexelVisible</b> Perform a visibility operation on the texel locations before the load. A following operand is the <a href="#">scope</a> that controls the visibility operation. Requires <b>NonPrivateTexel</b> to also be set. Only valid with <a href="#">OpImageRead</a> and <a href="#">OpImageSparseRead</a> .	<b>VulkanMemoryModel</b>  Missing before version 1.5.
0x200	<b>MakeTexelVisibleKHR</b>	<b>VulkanMemoryModel</b>  Missing before version 1.5.  Also see extension: <b>SPV_KHR_vulkan_memory_model</b>
0x400	<b>NonPrivateTexel</b> The image access obeys inter-thread ordering, as specified by the client API.	<b>VulkanMemoryModel</b>  Missing before version 1.5.
0x400	<b>NonPrivateTexelKHR</b>	<b>VulkanMemoryModel</b>  Missing before version 1.5.  Also see extension: <b>SPV_KHR_vulkan_memory_model</b>
0x800	<b>VolatileTexel</b> This access cannot be eliminated, duplicated, or combined with other accesses.	<b>VulkanMemoryModel</b>  Missing before version 1.5.

Image Operands		Enabling Capabilities
0x800	<b>VolatileTexelKHR</b>	<b>VulkanMemoryModel</b>  Missing before version 1.5.  Also see extension: <b>SPV_KHR_vulkan_memory_model</b>
0x1000	<b>SignExtend</b> The texel value is converted to the target value via sign extension. Only valid when the texel type is a scalar or vector of <a href="#">integer type</a> .	Missing before version 1.4.
0x2000	<b>ZeroExtend</b> The texel value is converted to the target value via zero extension. Only valid when the texel type is a scalar or vector of <a href="#">integer type</a> .	Missing before version 1.4.

### 3.15 FP Fast Math Mode

Enables fast math operations which are otherwise unsafe.

- Only valid on [OpFAdd](#), [OpFSub](#), [OpFMul](#), [OpFDiv](#), [OpFRem](#), and [OpFMod](#) instructions.

This value is a literal mask; it can be formed by combining the bits from multiple rows in the table below.

FP Fast Math Mode		Enabling Capabilities
0x0	<b>None</b>	
0x1	<b>NotNaN</b> Assume parameters and result are not NaN.	<b>Kernel</b>
0x2	<b>NotInf</b> Assume parameters and result are not +/- Inf.	<b>Kernel</b>
0x4	<b>NSZ</b> Treat the sign of a zero parameter or result as insignificant.	<b>Kernel</b>
0x8	<b>AllowRecip</b> Allow the usage of reciprocal rather than perform a division.	<b>Kernel</b>
0x10	<b>Fast</b> Allow algebraic transformations according to real-number associative and distributive algebra. This flag implies all the others.	<b>Kernel</b>

### 3.16 FP Rounding Mode

Associate a rounding mode to a floating-point conversion instruction.

FP Rounding Mode	
0	<b>RTE</b> Round to nearest even.
1	<b>RTZ</b> Round towards zero.
2	<b>RTP</b> Round towards positive infinity.

FP Rounding Mode	
3	<b>RTN</b> Round towards negative infinity.

### 3.17 Linkage Type

Associate a linkage type to functions or global variables. See [linkage](#).

Linkage Type		Enabling Capabilities
0	<b>Export</b> Accessible by other modules as well.	<b>Linkage</b>
1	<b>Import</b> A declaration of a global variable or a function that exists in another module.	<b>Linkage</b>

### 3.18 Access Qualifier

Defines the access permissions.

Used by [OpTypeImage](#) and [OpTypePipe](#).

Access Qualifier		Enabling Capabilities
0	<b>ReadOnly</b> A read-only object.	<b>Kernel</b>
1	<b>WriteOnly</b> A write-only object.	<b>Kernel</b>
2	<b>ReadWrite</b> A readable and writable object.	<b>Kernel</b>

### 3.19 Function Parameter Attribute

Adds additional information to the return type and to each parameter of a function.

Function Parameter Attribute		Enabling Capabilities
0	<b>Zext</b> Value should be zero extended if needed.	<b>Kernel</b>
1	<b>Sext</b> Value should be sign extended if needed.	<b>Kernel</b>
2	<b>ByVal</b> This indicates that the pointer parameter should really be passed by value to the function. Only valid for pointer parameters (not for ret value).	<b>Kernel</b>
3	<b>Sret</b> Indicates that the pointer parameter specifies the address of a structure that is the return value of the function in the source program. Only applicable to the first parameter which must be a pointer parameters.	<b>Kernel</b>
4	<b>NoAlias</b> Indicates that the memory pointed to by a pointer parameter is not accessed via pointer values which are not derived from this pointer parameter. Only valid for pointer parameters. Not valid on return values.	<b>Kernel</b>

Function Parameter Attribute		Enabling Capabilities
5	<b>NoCapture</b> The callee does not make a copy of the pointer parameter into a location that is accessible after returning from the callee. Only valid for pointer parameters. Not valid on return values.	Kernel
6	<b>NoWrite</b> Can only read the memory pointed to by a pointer parameter. Only valid for pointer parameters. Not valid on return values.	Kernel
7	<b>NoReadWrite</b> Cannot dereference the memory pointed to by a pointer parameter. Only valid for pointer parameters. Not valid on return values.	Kernel

### 3.20 Decoration

Used by:

- [OpDecorate](#)
- [OpMemberDecorate](#)
- [OpDecorateId](#)
- [OpDecorateString](#)
- [OpDecorateStringGOOGLE](#)
- [OpMemberDecorateString](#)
- [OpMemberDecorateStringGOOGLE](#)

Decoration		Extra Operands	Enabling Capabilities
0	<b>RelaxedPrecision</b> Allow reduced precision operations. To be used as described in <a href="#">Relaxed Precision</a> .		Shader
1	<b>SpecId</b> Apply to a scalar specialization constant. <i>Specialization Constant ID</i> is an unsigned 32-bit integer forming the external linkage for setting a specialized value. See <a href="#">specialization</a> .	<a href="#">Literal</a> <i>Specialization Constant ID</i>	Shader, Kernel
2	<b>Block</b> Apply to a structure type to establish it is a non-SSBO-like shader-interface block.		Shader
3	<b>BufferBlock</b> <a href="#">Deprecated</a> (use <b>Block</b> -decorated <b>StorageBuffer Storage Class</b> objects). Apply to a structure type to establish it is an SSBO-like shader-interface block.		Shader  <a href="#">Missing after version 1.3.</a>

	Decoration	Extra Operands	Enabling Capabilities
4	<b>RowMajor</b> Applies only to a member of a structure type. Only valid on a matrix or array whose most basic element is a matrix. Indicates that components within a row are contiguous in memory. Must not be used with <b>ColMajor</b> on the same matrix or matrix aggregate.		<b>Matrix</b>
5	<b>ColMajor</b> Applies only to a member of a structure type. Only valid on a matrix or array whose most basic element is a matrix. Indicates that components within a column are contiguous in memory. Must not be used with <b>RowMajor</b> on the same matrix or matrix aggregate.		<b>Matrix</b>
6	<b>ArrayStride</b> Apply to an array type to specify the stride, in bytes, of the array's elements. Can also apply to a pointer type to an array element. <i>Array Stride</i> is an unsigned 32-bit integer specifying the stride of the array that the element resides in. Must not be applied to any other type.	<b>Literal</b> <i>Array Stride</i>	<b>Shader</b>
7	<b>MatrixStride</b> Applies only to a member of a structure type. Only valid on a matrix or array whose most basic element is a matrix. <i>Matrix Stride</i> is an unsigned 32-bit integer specifying the stride of the rows in a <b>RowMajor</b> -decorated matrix or columns in a <b>ColMajor</b> -decorated matrix.	<b>Literal</b> <i>Matrix Stride</i>	<b>Matrix</b>
8	<b>GLSLShared</b> Apply to a structure type to get GLSL <b>shared</b> memory layout.		<b>Shader</b>
9	<b>GLSLPacked</b> Apply to a structure type to get GLSL <b>packed</b> memory layout.		<b>Shader</b>
10	<b>CPacked</b> Apply to a structure type, to marks it as "packed", indicating that the alignment of the structure is one and that there is no padding between structure members.		<b>Kernel</b>
11	<b>BuiltIn</b> Indicates which built-in variable an object represents. See <b>BuiltIn</b> for more information.	<b>BuiltIn</b>	

	Decoration	Extra Operands	Enabling Capabilities
13	<b>NoPerspective</b> Must only be used on a <a href="#">memory object declaration</a> or a member of a structure type. Indicates that linear, non-perspective correct, interpolation must be used. Only valid for the <b>Input</b> and <b>Output Storage Classes</b> .		Shader
14	<b>Flat</b> Must only be used on a <a href="#">memory object declaration</a> or a member of a structure type. Indicates no interpolation will be done. The non-interpolated value will come from a vertex, as specified by the client API. Only valid for the <b>Input</b> and <b>Output Storage Classes</b> .		Shader
15	<b>Patch</b> Must only be used on a <a href="#">memory object declaration</a> or a member of a structure type. Indicates a tessellation patch. Only valid for the <b>Input</b> and <b>Output Storage Classes</b> . Invalid to use on objects or types referenced by non-tessellation <a href="#">Execution Models</a> .		Tessellation
16	<b>Centroid</b> Must only be used on a <a href="#">memory object declaration</a> or a member of a structure type. When used with multi-sampling rasterization, allows a single interpolation location for an entire pixel. The interpolation location must lie in both the pixel and in the primitive being rasterized. Only valid for the <b>Input</b> and <b>Output Storage Classes</b> .		Shader
17	<b>Sample</b> Must only be used on a <a href="#">memory object declaration</a> or a member of a structure type. When used with multi-sampling rasterization, requires per-sample interpolation. The interpolation locations must be the locations of the samples lying in both the pixel and in the primitive being rasterized. Only valid for the <b>Input</b> and <b>Output Storage Classes</b> .		SampleRateShading
18	<b>Invariant</b> Apply to a variable or member of a block-decorated structure type to indicate that expressions computing its value be computed invariantly with respect to other shaders computing the same expressions.		Shader
19	<b>Restrict</b> Apply to a <a href="#">memory object declaration</a> , to indicate the compiler may compile as if there is no aliasing. See the <a href="#">Aliasing</a> section for more detail.		

Decoration		Extra Operands	Enabling Capabilities
20	<p><b>Aliased</b></p> <p>Apply to a <a href="#">memory object declaration</a>, to indicate the compiler is to generate accesses to the variable that work correctly in the presence of aliasing. See the <a href="#">Aliasing</a> section for more detail.</p>		
21	<p><b>Volatile</b></p> <p>Must be applied only to <a href="#">memory object declarations</a> or members of a structure type. Any such memory object declaration, or any memory object declaration that contains such a structure type, must be one of:</p> <ul style="list-style-type: none"> <li>- A storage image (see <a href="#">OpTypeImage</a>).</li> <li>- A block in the <b>StorageBuffer</b> <a href="#">storage class</a>, or in the <b>Uniform</b> <a href="#">storage class</a> with the <b>BufferBlock</b> decoration.</li> </ul> <p>This indicates the memory holding the variable is volatile memory. Accesses to volatile memory cannot be eliminated, duplicated, or combined with other accesses. Volatile applies only to a single invocation and does not guarantee each invocation performs the access.</p> <p><b>Volatile</b> is not allowed when the declared <a href="#">memory model</a> is <b>Vulkan</b>. The <a href="#">memory operand</a> bit <b>Volatile</b>, the <a href="#">image operand</a> bit <b>VolatileTexel</b>, or the <a href="#">memory semantic</a> bit <b>Volatile</b> can be used instead.</p>		
22	<p><b>Constant</b></p> <p>Indicates that a global variable is constant and will <b>never</b> be modified. Only allowed on global variables.</p>		<b>Kernel</b>
23	<p><b>Coherent</b></p> <p>Must be applied only to <a href="#">memory object declarations</a> or members of a structure type. Any such memory object declaration, or any memory object declaration that contains such a structure type, must be one of:</p> <ul style="list-style-type: none"> <li>- A storage image (see <a href="#">OpTypeImage</a>).</li> <li>- A block in the <b>StorageBuffer</b> <a href="#">storage class</a>, or in the <b>Uniform</b> <a href="#">storage class</a> with the <b>BufferBlock</b> decoration.</li> </ul> <p>This indicates the memory backing the object is coherent.</p> <p><b>Coherent</b> is not allowed when the declared <a href="#">memory model</a> is <b>Vulkan</b>. The <a href="#">memory operand</a> bits <b>MakePointerAvailable</b> and <b>MakePointerVisible</b> or the <a href="#">image operand</a> bits <b>MakeTexelAvailable</b> and <b>MakeTexelVisible</b> can be used instead.</p>		

	Decoration	Extra Operands	Enabling Capabilities
24	<p><b>NonWritable</b></p> <p>Must be applied only to <a href="#">memory object declarations</a> or members of a structure type. Any such memory object declaration, or any memory object declaration that contains such a structure type, must be one of:</p> <ul style="list-style-type: none"> <li>- A storage image (see <a href="#">OpTypeImage</a>).</li> <li>- A block in the <b>StorageBuffer storage class</b>, or in the <b>Uniform storage class</b> with the <b>BufferBlock</b> decoration.</li> <li>- <a href="#">Missing before version 1.4</a>: An object in the <b>Private</b> or <b>Function</b> storage classes.</li> </ul> <p>This decoration indicates the memory holding the variable is not writable, and that this module does not write to it. It does not prevent the use of initializers on a declaration.</p>		
25	<p><b>NonReadable</b></p> <p>Must be applied only to <a href="#">memory object declarations</a> or members of a structure type. Any such memory object declaration, or any memory object declaration that contains such a structure type, must be one of:</p> <ul style="list-style-type: none"> <li>- A storage image (see <a href="#">OpTypeImage</a>).</li> <li>- A block in the <b>StorageBuffer storage class</b>, or in the <b>Uniform storage class</b> with the <b>BufferBlock</b> decoration.</li> </ul> <p>This indicates the memory holding the variable is not readable, and that this module does not read from it.</p>		
26	<p><b>Uniform</b></p> <p>Apply to an object. Asserts that, for each <a href="#">dynamic instance</a> of the instruction that computes the result, all active invocations in the invocation's <b>Subgroup</b> scope will compute the same result value.</p>		<b>Shader</b>
27	<p><b>UniformId</b></p> <p>Apply to an object. Asserts that, for each <a href="#">dynamic instance</a> of the instruction that computes the result, all active invocations in the <i>Execution</i> scope compute the same result value. <i>Execution</i> must not be <b>Invocation</b>.</p>	<p><a href="#">Scope &lt;id&gt;</a> <i>Execution</i></p>	<p><b>Shader</b></p> <p><a href="#">Missing before version 1.4</a>.</p>

	Decoration	Extra Operands	Enabling Capabilities
28	<p><b>SaturatedConversion</b> Indicates that a conversion to an integer type which is outside the representable range of <i>Result Type</i> will be clamped to the nearest representable value of <i>Result Type</i>. <i>NaN</i> will be converted to 0.</p> <p>This decoration can only be applied to conversion instructions to integer types, not including the <a href="#">OpSatConvertUToS</a> and <a href="#">OpSatConvertSToU</a> instructions.</p>		<b>Kernel</b>
29	<p><b>Stream</b> Must only be used on a <a href="#">memory object declaration</a> or a member of a structure type. <i>Stream Number</i> is an unsigned 32-bit integer indicating the stream number to put an output on. Only valid for the <b>Output Storage Class</b> and the <b>Geometry Execution Model</b>.</p>	<a href="#">Literal Stream Number</a>	<b>GeometryStreams</b>
30	<p><b>Location</b> Apply to a variable or a structure-type member. <i>Location</i> is an unsigned 32-bit integer that forms the main linkage for <a href="#">Storage Class Input</a> and <b>Output</b> variables:  - between the client API and vertex-stage inputs,  - between consecutive programmable stages, or  - between fragment-stage outputs and the client API.  It can also tag variables or structure-type members in the <b>UniformConstant Storage Class</b> for linkage with the client API. Only valid for the <b>Input</b>, <b>Output</b>, and <b>UniformConstant Storage Classes</b>.</p>	<a href="#">Literal Location</a>	<b>Shader</b>
31	<p><b>Component</b> Must only be used on a <a href="#">memory object declaration</a> or a member of a structure type. <i>Component</i> is an unsigned 32-bit integer indicating which component within a <b>Location</b> will be taken by the decorated entity. Only valid for the <b>Input</b> and <b>Output Storage Classes</b>.</p>	<a href="#">Literal Component</a>	<b>Shader</b>
32	<p><b>Index</b> Apply to a variable. <i>Index</i> is an unsigned 32-bit integer identifying a blend equation input index, used as specified by the client API. Only valid for the <b>Output Storage Class</b> and the <b>Fragment Execution Model</b>.</p>	<a href="#">Literal Index</a>	<b>Shader</b>

	Decoration	Extra Operands	Enabling Capabilities
33	<b>Binding</b> Apply to a variable. <i>Binding Point</i> is an unsigned 32-bit integer forming part of the linkage between the client API and SPIR-V memory buffers, images, etc. See the client API specification for more detail.	<a href="#">Literal</a> <i>Binding Point</i>	Shader
34	<b>DescriptorSet</b> Apply to a variable. <i>Descriptor Set</i> is an unsigned 32-bit integer forming part of the linkage between the client API and SPIR-V memory buffers, images, etc. See the client API specification for more detail.	<a href="#">Literal</a> <i>Descriptor Set</i>	Shader
35	<b>Offset</b> Apply to a structure-type member. <i>Byte Offset</i> is an unsigned 32-bit integer. It dictates the byte offset of the member relative to the beginning of the structure. It can be used, for example, by both uniform and transform-feedback buffers. It must not cause any overlap of the structure's members, or overflow of a transform-feedback buffer's <b>XfbStride</b> .	<a href="#">Literal</a> <i>Byte Offset</i>	Shader
36	<b>XfbBuffer</b> Must only be used on a <a href="#">memory object declaration</a> or a member of a structure type. <i>XFB Buffer</i> is an unsigned 32-bit integer indicating which transform-feedback buffer an output is written to. Only valid for the <a href="#">Output Storage Classes</a> of <a href="#">vertex processing Execution Models</a> .	<a href="#">Literal</a> <i>XFB Buffer Number</i>	TransformFeedback
37	<b>XfbStride</b> Apply to anything <b>XfbBuffer</b> is applied to. <i>XFB Stride</i> is an unsigned 32-bit integer specifying the stride, in bytes, of transform-feedback buffer vertices. If the transform-feedback buffer is capturing any double-precision components, the stride must be a multiple of 8, otherwise it must be a multiple of 4.	<a href="#">Literal</a> <i>XFB Stride</i>	TransformFeedback
38	<b>FuncParamAttr</b> Indicates a function return value or parameter attribute.	<a href="#">Function Parameter Attribute</a> <i>Function Parameter Attribute</i>	Kernel
39	<b>FPRoundingMode</b> Indicates a floating-point rounding mode.	<a href="#">FP Rounding Mode</a> <i>Floating-Point Rounding Mode</i>	

	Decoration	Extra Operands		Enabling Capabilities
40	<b>FPFastMathMode</b> Indicates a floating-point fast math flag.	<b>FP Fast Math Mode</b> <i>Fast-Math Mode</i>		<b>Kernel</b>
41	<b>LinkageAttributes</b> Associate linkage attributes to values. <i>Name</i> is a string specifying what name the <i>Linkage Type</i> applies to. Only valid on <b>OpFunction</b> or global (module scope) <b>OpVariable</b> . See <b>linkage</b> .	<b>Literal Name</b>	<b>Linkage Type</b> <i>Linkage Type</i>	<b>Linkage</b>
42	<b>NoContraction</b> Apply to an <b>arithmetic instruction</b> to indicate the operation cannot be combined with another instruction to form a single operation. For example, if applied to an <b>OpFMul</b> , that multiply can't be combined with an addition to yield a fused multiply-add operation. Furthermore, such operations are not allowed to reassociate; e.g., <code>add(a + add(b+c))</code> cannot be transformed to <code>add(add(a+b) + c)</code> .			<b>Shader</b>
43	<b>InputAttachmentIndex</b> Apply to a variable. <i>Attachment Index</i> is an unsigned 32-bit integer providing an input-target index (as specified by the client API). Only valid in the <b>Fragment Execution Model</b> and for variables of type <b>OpTypeImage</b> with a <b>Dim</b> operand of <b>SubpassData</b> .	<b>Literal Attachment Index</b>		<b>InputAttachment</b>
44	<b>Alignment</b> Apply to a pointer. <i>Alignment</i> is an unsigned 32-bit integer declaring a known minimum alignment the pointer has.	<b>Literal Alignment</b>		<b>Kernel</b>
45	<b>MaxByteOffset</b> Apply to a pointer. <i>Max Byte Offset</i> is an unsigned 32-bit integer declaring a known maximum byte offset this pointer will be incremented by from the point of the decoration. This is a guaranteed upper bound when applied to <b>OpFunctionParameter</b> .	<b>Literal Max Byte Offset</b>		<b>Addresses</b>  <b>Missing before version 1.1.</b>
46	<b>AlignmentId</b> Same as the <b>Alignment decoration</b> , but using an <code>&lt;id&gt;</code> operand instead of a literal. The operand is consumed as unsigned and must be an <b>integer type</b> scalar.	<code>&lt;id&gt;</code> <i>Alignment</i>		<b>Kernel</b>  <b>Missing before version 1.2.</b>
47	<b>MaxByteOffsetId</b> Same as the <b>MaxByteOffset decoration</b> , but using an <code>&lt;id&gt;</code> operand instead of a literal. The operand is consumed as unsigned and must be an <b>integer type</b> scalar.	<code>&lt;id&gt;</code> <i>Max Byte Offset</i>		<b>Addresses</b>  <b>Missing before version 1.2.</b>

	Decoration	Extra Operands	Enabling Capabilities
4469	<p><b>NoSignedWrap</b> Apply to an instruction to indicate that it does not cause signed integer wrapping to occur, in the form of overflow or underflow.</p> <p>It can decorate only the following instructions:</p> <ul style="list-style-type: none"> <li>- <b>OpIAdd</b></li> <li>- <b>OpISub</b></li> <li>- <b>OpIMul</b></li> <li>- <b>OpShiftLeftLogical</b></li> <li>- <b>OpSNegate</b></li> <li>- <b>OpExtInst</b> for instruction numbers specified in the extended instruction-set specifications as accepting this decoration.</li> </ul> <p>If an instruction decorated with <b>NoSignedWrap</b> does overflow or underflow, the behavior is undefined.</p>		<p>Missing before version 1.4.</p> <p>Also see extension: <b>SPV_KHR_no_integer_wrap_decoration</b></p>
4470	<p><b>NoUnsignedWrap</b> Apply to an instruction to indicate that it does not cause unsigned integer wrapping to occur, in the form of overflow or underflow.</p> <p>It can decorate only the following instructions:</p> <ul style="list-style-type: none"> <li>- <b>OpIAdd</b></li> <li>- <b>OpISub</b></li> <li>- <b>OpIMul</b></li> <li>- <b>OpShiftLeftLogical</b></li> <li>- <b>OpExtInst</b> for instruction numbers specified in the extended instruction-set specifications as accepting this decoration.</li> </ul> <p>If an instruction decorated with <b>NoUnsignedWrap</b> does overflow or underflow, the behavior is undefined.</p>		<p>Missing before version 1.4.</p> <p>Also see extension: <b>SPV_KHR_no_integer_wrap_decoration</b></p>
4999	<b>ExplicitInterpAMD</b>		<p>Reserved.</p> <p>Also see extension: <b>SPV_AMD_shader_explicit_vertex_parameter</b></p>
5248	<b>OverrideCoverageNV</b>		<p><b>SampleMaskOverrideCoverageNV</b></p> <p>Reserved.</p> <p>Also see extension: <b>SPV_NV_sample_mask_override_coverage</b></p>
5250	<b>PassthroughNV</b>		<p><b>GeometryShaderPassthroughNV</b></p> <p>Reserved.</p> <p>Also see extension: <b>SPV_NV_geometry_shader_passthrough</b></p>

	Decoration	Extra Operands	Enabling Capabilities
5252	<b>ViewportRelativeNV</b>		<b>ShaderViewportMaskNV</b>  Reserved.
5256	<b>SecondaryViewportRelativeNV</b>	<i>Literal Offset</i>	<b>ShaderStereoViewNV</b>  Reserved.  Also see extension: <b>SPV_NV_stereo_view_rendering</b>
5271	<b>PerPrimitiveNV</b>		<b>MeshShadingNV</b>  Reserved.  Also see extension: <b>SPV_NV_mesh_shader</b>
5272	<b>PerViewNV</b>		<b>MeshShadingNV</b>  Reserved.  Also see extension: <b>SPV_NV_mesh_shader</b>
5273	<b>PerTaskNV</b>		<b>MeshShadingNV</b>  Reserved.  Also see extension: <b>SPV_NV_mesh_shader</b>
5285	<b>PerVertexNV</b>		<b>FragmentBarycentricNV</b>  Reserved.  Also see extension: <b>SPV_NV_fragment_shader_barycentric</b>
5300	<b>NonUniform</b> Apply to an object. Asserts that the value backing the decorated <id> is <b>not dynamically uniform</b> . See the client API specification for more detail.		<b>ShaderNonUniform</b>  Missing before version 1.5.
5300	<b>NonUniformEXT</b>		<b>ShaderNonUniform</b>  Missing before version 1.5.  Also see extension: <b>SPV_EXT_descriptor_indexing</b>
5355	<b>RestrictPointer</b> Apply to an <b>OpVariable</b> , to indicate the compiler may compile as if there is no aliasing of the pointer stored in the variable. See the <b>aliasing section</b> for more detail.		<b>PhysicalStorageBufferAddresses</b>  Missing before version 1.5.  Also see extensions: <b>SPV_EXT_physical_storage_buffer</b> , <b>SPV_KHR_physical_storage_buffer</b>

	Decoration	Extra Operands	Enabling Capabilities
5355	<b>RestrictPointerEXT</b>		<b>PhysicalStorageBufferAddresses</b>  Missing before version 1.5.  Also see extension: <b>SPV_EXT_physical_storage_buffer</b>
5356	<b>AliasedPointer</b> Apply to an <b>OpVariable</b> , to indicate the compiler is to generate accesses to the pointer stored in the variable that work correctly in the presence of aliasing. See the <a href="#">aliasing section</a> for more detail.		<b>PhysicalStorageBufferAddresses</b>  Missing before version 1.5.  Also see extensions: <b>SPV_EXT_physical_storage_buffer</b> , <b>SPV_KHR_physical_storage_buffer</b>
5356	<b>AliasedPointerEXT</b>		<b>PhysicalStorageBufferAddresses</b>  Missing before version 1.5.  Also see extension: <b>SPV_EXT_physical_storage_buffer</b>
5634	<b>CounterBuffer</b> The <i>&lt;id&gt;</i> of a counter buffer associated with the decorated buffer. It can decorate only a variable in the <b>Uniform storage class</b> . <i>Counter Buffer</i> must be a variable in the <b>Uniform</b> storage class.	<i>&lt;id&gt;</i> <i>Counter Buffer</i>	Missing before version 1.4.
5634	<b>HlslCounterBufferGOOGLE</b>	<i>&lt;id&gt;</i> <i>Counter Buffer</i>	Reserved.  Also see extension: <b>SPV_GOOGLE_hlsl_functionality1</b>
5635	<b>UserSemantic</b> <i>Semantic</i> is a string describing a user-defined semantic intent of what it decorates. User-defined semantics are case insensitive. It can decorate only a variable or a member of a structure type. If decorating a variable, it must be in the <b>Input</b> or <b>Output storage classes</b> .	<b>Literal</b> <i>Semantic</i>	Missing before version 1.4.
5635	<b>HlslSemanticGOOGLE</b>	<b>Literal</b> <i>Semantic</i>	Reserved.  Also see extension: <b>SPV_GOOGLE_hlsl_functionality1</b>
5636	<b>UserTypeGOOGLE</b>	<b>Literal</b> <i>User Type</i>	Reserved.  Also see extension: <b>SPV_GOOGLE_user_type</b>

### 3.21 BuiltIn

Used when [Decoration](#) is **BuiltIn**. Apply to:

- the result *<id>* of the **OpVariable** declaration of the built-in variable, or

- a structure-type member, if the built-in is a member of a structure, or
- a [constant instruction](#), if the built-in is a constant.

As stated per entry below, these have additional semantics and constraints specified by the client API.

<b>BuiltIn</b>		<b>Enabling Capabilities</b>
0	<b>Position</b> Output vertex position from a <a href="#">vertex processing Execution Model</a> . See the client API specification for more detail.	<b>Shader</b>
1	<b>PointSize</b> Output point size from a <a href="#">vertex processing Execution Model</a> . See the client API specification for more detail.	<b>Shader</b>
3	<b>ClipDistance</b> Array of clip distances. See the client API specification for more detail.	<b>ClipDistance</b>
4	<b>CullDistance</b> Array of clip distances. See the client API specification for more detail.	<b>CullDistance</b>
5	<b>VertexId</b> Input vertex ID to a <a href="#">Vertex Execution Model</a> . See the client API specification for more detail.	<b>Shader</b>
6	<b>InstanceId</b> Input instance ID to a <a href="#">Vertex Execution Model</a> . See the client API specification for more detail.	<b>Shader</b>
7	<b>PrimitiveId</b> Primitive ID in a <a href="#">Geometry Execution Model</a> . See the client API specification for more detail.	<b>Geometry, Tessellation, RayTracingNV</b>
8	<b>InvocationId</b> Invocation ID, input to <b>Geometry</b> and <b>TessellationControl Execution Model</b> . See the client API specification for more detail.	<b>Geometry, Tessellation</b>
9	<b>Layer</b> Layer selection for multi-layer framebuffer. See the client API specification for more detail.  The <b>Geometry capability</b> allows for a <b>Layer</b> output by a <a href="#">Geometry Execution Model</a> , input to a <b>Fragment Execution Model</b> .  The <b>ShaderLayer capability</b> allows for <b>Layer</b> output by a <a href="#">Vertex</a> or <a href="#">Tessellation Execution Model</a> .	<b>Geometry, ShaderLayer, ShaderViewportIndexLayerEXT</b>
10	<b>ViewportIndex</b> Viewport selection for viewport transformation when using multiple viewports. See the client API specification for more detail.  The <b>MultiViewport capability</b> allows for a <b>ViewportIndex</b> output by a <a href="#">Geometry Execution Model</a> , input to a <a href="#">Fragment Execution Model</a> .  The <b>ShaderViewportIndex capability</b> allows for a <b>ViewportIndex</b> output by a <a href="#">Vertex</a> or <a href="#">Tessellation Execution Model</a> .	<b>MultiViewport, ShaderViewportIndex, ShaderViewportIndexLayerEXT</b>

BuiltIn		Enabling Capabilities
11	<b>TessLevelOuter</b> Output patch outer levels in a <b>TessellationControl Execution Model</b> . See the client API specification for more detail.	Tessellation
12	<b>TessLevelInner</b> Output patch inner levels in a <b>TessellationControl Execution Model</b> . See the client API specification for more detail.	Tessellation
13	<b>TessCoord</b> Input vertex position in <b>TessellationEvaluation Execution Model</b> . See the client API specification for more detail.	Tessellation
14	<b>PatchVertices</b> Input patch vertex count in a tessellation <b>Execution Model</b> . See the client API specification for more detail.	Tessellation
15	<b>FragCoord</b> Coordinates ( $x, y, z, 1/w$ ) of the current fragment, input to the <b>Fragment Execution Model</b> . See the client API specification for more detail.	Shader
16	<b>PointCoord</b> Coordinates within a <i>point</i> , input to the <b>Fragment Execution Model</b> . See the client API specification for more detail.	Shader
17	<b>FrontFacing</b> Face direction, input to the <b>Fragment Execution Model</b> . See the client API specification for more detail.	Shader
18	<b>SampleId</b> Input sample number to the <b>Fragment Execution Model</b> . See the client API specification for more detail.	SampleRateShading
19	<b>SamplePosition</b> Input sample position to the <b>Fragment Execution Model</b> . See the client API specification for more detail.	SampleRateShading
20	<b>SampleMask</b> Input or output sample mask to the <b>Fragment Execution Model</b> . See the client API specification for more detail.	Shader
22	<b>FragDepth</b> Output fragment depth from the <b>Fragment Execution Model</b> . See the client API specification for more detail.	Shader
23	<b>HelperInvocation</b> Input whether a helper invocation, to the <b>Fragment Execution Model</b> . See the client API specification for more detail.	Shader
24	<b>NumWorkgroups</b> Number of workgroups in <b>GLCompute</b> or <b>Kernel Execution Models</b> . See the client API specification for more detail.	
25	<b>WorkgroupSize</b> Work-group size in <b>GLCompute</b> or <b>Kernel Execution Models</b> . See the client API specification for more detail.	

	BuiltIn	Enabling Capabilities
26	<b>WorkgroupId</b> Work-group ID in <b>GLCompute</b> or <b>Kernel Execution Models</b> . See the client API specification for more detail.	
27	<b>LocalInvocationId</b> Local invocation ID in <b>GLCompute</b> or <b>Kernel Execution Models</b> . See the client API specification for more detail.	
28	<b>GlobalInvocationId</b> Global invocation ID in <b>GLCompute</b> or <b>Kernel Execution Models</b> . See the client API specification for more detail.	
29	<b>LocalInvocationIndex</b> Local invocation index in <b>GLCompute Execution Models</b> . See the client API specification for more detail.  Work-group Linear ID in <b>Kernel Execution Models</b> . See the client API specification for more detail.	
30	<b>WorkDim</b> Work dimensions in <b>Kernel Execution Models</b> . See the client API specification for more detail.	<b>Kernel</b>
31	<b>GlobalSize</b> Global size in <b>Kernel Execution Models</b> . See the client API specification for more detail.	<b>Kernel</b>
32	<b>EnqueuedWorkgroupSize</b> Enqueued work-group size in <b>Kernel Execution Models</b> . See the client API specification for more detail.	<b>Kernel</b>
33	<b>GlobalOffset</b> Global offset in <b>Kernel Execution Models</b> . See the client API specification for more detail.	<b>Kernel</b>
34	<b>GlobalLinearId</b> Global linear ID in <b>Kernel Execution Models</b> . See the client API specification for more detail.	<b>Kernel</b>
36	<b>SubgroupSize</b> Subgroup size. See the client API specification for more detail.	<b>Kernel, GroupNonUniform, SubgroupBallotKHR</b>
37	<b>SubgroupMaxSize</b> Subgroup maximum size in <b>Kernel Execution Models</b> . See the client API specification for more detail.	<b>Kernel</b>
38	<b>NumSubgroups</b> Number of subgroups in <b>GLCompute</b> or <b>Kernel Execution Models</b> . See the client API specification for more detail.	<b>Kernel, GroupNonUniform</b>
39	<b>NumEnqueuedSubgroups</b> Number of enqueued subgroups in <b>Kernel Execution Models</b> . See the client API specification for more detail.	<b>Kernel</b>
40	<b>SubgroupId</b> Subgroup ID in <b>GLCompute</b> or <b>Kernel Execution Models</b> . See the client API specification for more detail.	<b>Kernel, GroupNonUniform</b>

<b>BuiltIn</b>		<b>Enabling Capabilities</b>
41	<b>SubgroupLocalInvocationId</b> Subgroup local invocation ID. See the client API specification for more detail.	<b>Kernel, GroupNonUniform, SubgroupBallotKHR</b>
42	<b>VertexIndex</b> Vertex index. See the client API specification for more detail.	<b>Shader</b>
43	<b>InstanceIndex</b> Instance index. See the client API specification for more detail.	<b>Shader</b>
4416	<b>SubgroupEqMask</b> Subgroup invocations bitmask where bit index == <b>SubgroupLocalInvocationId</b> . See the client API specification for more detail.	<b>SubgroupBallotKHR, GroupNonUniformBallot</b>  <a href="#">Missing before version 1.3.</a>
4417	<b>SubgroupGeMask</b> Subgroup invocations bitmask where bit index >= <b>SubgroupLocalInvocationId</b> . See the client API specification for more detail.	<b>SubgroupBallotKHR, GroupNonUniformBallot</b>  <a href="#">Missing before version 1.3.</a>
4418	<b>SubgroupGtMask</b> Subgroup invocations bitmask where bit index > <b>SubgroupLocalInvocationId</b> . See the client API specification for more detail.	<b>SubgroupBallotKHR, GroupNonUniformBallot</b>  <a href="#">Missing before version 1.3.</a>
4419	<b>SubgroupLeMask</b> Subgroup invocations bitmask where bit index <= <b>SubgroupLocalInvocationId</b> . See the client API specification for more detail.	<b>SubgroupBallotKHR, GroupNonUniformBallot</b>  <a href="#">Missing before version 1.3.</a>
4420	<b>SubgroupLtMask</b> Subgroup invocations bitmask where bit index < <b>SubgroupLocalInvocationId</b> . See the client API specification for more detail.	<b>SubgroupBallotKHR, GroupNonUniformBallot</b>  <a href="#">Missing before version 1.3.</a>
4416	<b>SubgroupEqMaskKHR</b>	<b>SubgroupBallotKHR, GroupNonUniformBallot</b>  <a href="#">Missing before version 1.3.</a>  Also see extension: <b>SPV_KHR_shader_ballot</b>
4417	<b>SubgroupGeMaskKHR</b>	<b>SubgroupBallotKHR, GroupNonUniformBallot</b>  <a href="#">Missing before version 1.3.</a>  Also see extension: <b>SPV_KHR_shader_ballot</b>
4418	<b>SubgroupGtMaskKHR</b>	<b>SubgroupBallotKHR, GroupNonUniformBallot</b>  <a href="#">Missing before version 1.3.</a>  Also see extension: <b>SPV_KHR_shader_ballot</b>
4419	<b>SubgroupLeMaskKHR</b>	<b>SubgroupBallotKHR, GroupNonUniformBallot</b>  <a href="#">Missing before version 1.3.</a>  Also see extension: <b>SPV_KHR_shader_ballot</b>
4420	<b>SubgroupLtMaskKHR</b>	<b>SubgroupBallotKHR, GroupNonUniformBallot</b>  <a href="#">Missing before version 1.3.</a>  Also see extension: <b>SPV_KHR_shader_ballot</b>

	<b>BuiltIn</b>	<b>Enabling Capabilities</b>
4424	<b>BaseVertex</b> Base vertex component of vertex ID. See the client API specification for more detail.	<b>DrawParameters</b>  <a href="#">Missing before version 1.3.</a>  Also see extension: <b>SPV_KHR_shader_draw_parameters</b>
4425	<b>BaseInstance</b> Base instance component of instance ID. See the client API specification for more detail.	<b>DrawParameters</b>  <a href="#">Missing before version 1.3.</a>  Also see extension: <b>SPV_KHR_shader_draw_parameters</b>
4426	<b>DrawIndex</b> Contains the index of the draw currently being processed. See the client API specification for more detail.	<b>DrawParameters, MeshShadingNV</b>  <a href="#">Missing before version 1.3.</a>  Also see extensions: <b>SPV_KHR_shader_draw_parameters,</b> <b>SPV_NV_mesh_shader</b>
4438	<b>DeviceIndex</b> Input device index of the logical device. See the client API specification for more detail.	<b>DeviceGroup</b>  <a href="#">Missing before version 1.3.</a>  Also see extension: <b>SPV_KHR_device_group</b>
4440	<b>ViewIndex</b> Input view index of the view currently being rendered to. See the client API specification for more detail.	<b>MultiView</b>  <a href="#">Missing before version 1.3.</a>  Also see extension: <b>SPV_KHR_multiview</b>
4992	<b>BaryCoordNoPerspAMD</b>	<a href="#">Reserved.</a>  Also see extension: <b>SPV_AMD_shader_explicit_vertex_parameter</b>
4993	<b>BaryCoordNoPerspCentroidAMD</b>	<a href="#">Reserved.</a>  Also see extension: <b>SPV_AMD_shader_explicit_vertex_parameter</b>
4994	<b>BaryCoordNoPerspSampleAMD</b>	<a href="#">Reserved.</a>  Also see extension: <b>SPV_AMD_shader_explicit_vertex_parameter</b>
4995	<b>BaryCoordSmoothAMD</b>	<a href="#">Reserved.</a>  Also see extension: <b>SPV_AMD_shader_explicit_vertex_parameter</b>
4996	<b>BaryCoordSmoothCentroidAMD</b>	<a href="#">Reserved.</a>  Also see extension: <b>SPV_AMD_shader_explicit_vertex_parameter</b>

### 3.22 Selection Control

This value is a literal mask; it can be formed by combining the bits from multiple rows in the table below.

Used by [OpSelectionMerge](#).

<b>Selection Control</b>	
0x0	<b>None</b>
0x1	<b>Flatten</b> Strong request, to the extent possible, to remove the control flow for this selection.
0x2	<b>DontFlatten</b> Strong request, to the extent possible, to keep this selection as control flow.

### 3.23 Loop Control

Loop controls. Bits that are set can indicate whether an additional operand follows, as described by the table. If there are multiple following operands indicated, they are ordered: Those indicated by smaller-numbered bits appear first.

This value is a literal mask; it can be formed by combining the bits from multiple rows in the table below.

Used by [OpLoopMerge](#).

<b>Loop Control</b>		<b>Enabling Capabilities</b>
0x0	<b>None</b>	
0x1	<b>Unroll</b> Strong request, to the extent possible, to unroll or unwind this loop. This must not be used with the <b>DontUnroll</b> bit.	
0x2	<b>DontUnroll</b> Strong request, to the extent possible, to keep this loop as a loop, without unrolling.	
0x4	<b>DependencyInfinite</b> Guarantees that there are no dependencies between loop iterations.	Missing before version 1.1.
0x8	<b>DependencyLength</b> Guarantees that there are no dependencies between a number of loop iterations. The dependency length is specified in a subsequent unsigned 32-bit integer literal operand.	Missing before version 1.1.
0x10	<b>MinIterations</b> Unchecked assertion that the loop will execute at least a given number of iterations. The iteration count is specified in a subsequent unsigned 32-bit integer literal operand.	Missing before version 1.4.

Loop Control		Enabling Capabilities
0x20	<b>MaxIterations</b> Unchecked assertion that the loop will execute at most a given number of iterations. The iteration count is specified in a subsequent unsigned 32-bit integer literal operand.	Missing before version 1.4.
0x40	<b>IterationMultiple</b> Unchecked assertion that the loop will execute a multiple of a given number of iterations. The number is specified in a subsequent unsigned 32-bit integer literal operand. It must be greater than 0.	Missing before version 1.4.
0x80	<b>PeelCount</b> Request that the loop be peeled by a given number of loop iterations. The peel count is specified in a subsequent unsigned 32-bit integer literal operand. This must not be used with the <b>DontUnroll</b> bit.	Missing before version 1.4.
0x100	<b>PartialCount</b> Request that the loop be partially unrolled by a given number of loop iterations. The unroll count is specified in a subsequent unsigned 32-bit integer literal operand. This must not be used with the <b>DontUnroll</b> bit.	Missing before version 1.4.

### 3.24 Function Control

This value is a literal mask; it can be formed by combining the bits from multiple rows in the table below.

Used by [OpFunction](#).

Function Control	
0x0	<b>None</b>
0x1	<b>Inline</b> Strong request, to the extent possible, to inline the function.
0x2	<b>DontInline</b> Strong request, to the extent possible, to not inline the function.
0x4	<b>Pure</b> Compiler can assume this function has no side effect, but might read global memory or read through dereferenced function parameters. Always computes the same result for the same argument values.
0x8	<b>Const</b> Compiler can assume this function has no side effects, and will not access global memory or dereference function parameters. Always computes the same result for the same argument values.

### 3.25 Memory Semantics <id>

Must be an <id> of a 32-bit integer scalar.

Memory semantics define memory-order constraints, and on what storage classes those constraints apply to. The memory order constrains the allowed orders in which memory operations in this [invocation](#) can be made visible to another invocation. The storage classes specify to which subsets of memory these constraints are to be applied. Storage classes not selected are not being constrained.

Despite being a mask and allowing multiple bits to be combined, it is invalid for more than one of these four bits to be set: **Acquire**, **Release**, **AcquireRelease**, or **SequentiallyConsistent**. Requesting both **Acquire** and **Release** semantics is done by setting the **AcquireRelease** bit, not by setting two bits.

This value is a mask; it can be formed by combining the bits from multiple rows in the table below.

Used by:

- [OpControlBarrier](#)
- [OpMemoryBarrier](#)
- [OpAtomicLoad](#)
- [OpAtomicStore](#)
- [OpAtomicExchange](#)
- [OpAtomicCompareExchange](#)
- [OpAtomicCompareExchangeWeak](#)
- [OpAtomicIncrement](#)
- [OpAtomicDecrement](#)
- [OpAtomicIAdd](#)
- [OpAtomicISub](#)
- [OpAtomicSMin](#)
- [OpAtomicUMin](#)
- [OpAtomicSMax](#)
- [OpAtomicUMax](#)
- [OpAtomicAnd](#)
- [OpAtomicOr](#)
- [OpAtomicXor](#)
- [OpAtomicFlagTestAndSet](#)
- [OpAtomicFlagClear](#)
- [OpMemoryNamedBarrier](#)

Memory Semantics		Enabling Capabilities
0x0	<b>None (Relaxed)</b>	
0x2	<b>Acquire</b> All memory operations provided in program order after this memory operation will execute after this memory operation.	
0x4	<b>Release</b> All memory operations provided in program order before this memory operation will execute before this memory operation.	

Memory Semantics		Enabling Capabilities
0x8	<b>AcquireRelease</b> Has the properties of both <a href="#">Acquire</a> and <a href="#">Release</a> semantics. It is used for read-modify-write operations.	
0x10	<b>SequentiallyConsistent</b> All observers will see this memory access in the same order with respect to other sequentially-consistent memory accesses from this <a href="#">invocation</a> . If the declared <a href="#">memory model</a> is <b>Vulkan</b> , <b>SequentiallyConsistent</b> must not be used.	
0x40	<b>UniformMemory</b> Apply the memory-ordering constraints to <b>StorageBuffer</b> , <b>PhysicalStorageBuffer</b> , or <b>Uniform Storage Class</b> memory.	<b>Shader</b>
0x80	<b>SubgroupMemory</b> Apply the memory-ordering constraints to subgroup memory.	
0x100	<b>WorkgroupMemory</b> Apply the memory-ordering constraints to <b>Workgroup Storage Class</b> memory.	
0x200	<b>CrossWorkgroupMemory</b> Apply the memory-ordering constraints to <b>CrossWorkgroup Storage Class</b> memory.	
0x400	<b>AtomicCounterMemory</b> Apply the memory-ordering constraints to <b>AtomicCounter Storage Class</b> memory.	<b>AtomicStorage</b>
0x800	<b>ImageMemory</b> Apply the memory-ordering constraints to image contents (types declared by <a href="#">OpTypeImage</a> ), or to accesses done through pointers to the <b>Image Storage Class</b> .	
0x1000	<b>OutputMemory</b> Apply the memory-ordering constraints to <b>Output storage class</b> memory.	<b>VulkanMemoryModel</b>  <a href="#">Missing before version 1.5.</a>
0x1000	<b>OutputMemoryKHR</b>	<b>VulkanMemoryModel</b>  <a href="#">Missing before version 1.5.</a>  Also see extension: <b>SPV_KHR_vulkan_memory_model</b>
0x2000	<b>MakeAvailable</b> Perform an availability operation on all references in the selected <a href="#">storage classes</a> .	<b>VulkanMemoryModel</b>  <a href="#">Missing before version 1.5.</a>
0x2000	<b>MakeAvailableKHR</b>	<b>VulkanMemoryModel</b>  <a href="#">Missing before version 1.5.</a>  Also see extension: <b>SPV_KHR_vulkan_memory_model</b>
0x4000	<b>MakeVisible</b> Perform a visibility operation on all references in the selected <a href="#">storage classes</a> .	<b>VulkanMemoryModel</b>  <a href="#">Missing before version 1.5.</a>

Memory Semantics		Enabling Capabilities
0x4000	<b>MakeVisibleKHR</b>	<b>VulkanMemoryModel</b>  Missing before version 1.5.  Also see extension: <b>SPV_KHR_vulkan_memory_model</b>
0x8000	<b>Volatile</b> This access cannot be eliminated, duplicated, or combined with other accesses.	<b>VulkanMemoryModel</b>  Missing before version 1.5.  Also see extension: <b>SPV_KHR_vulkan_memory_model</b>

### 3.26 Memory Operands

Additional operands to the listed memory instructions. Bits that are set can indicate whether an additional operand follows, as described by the table. If there are multiple following operands indicated, they are ordered: Those indicated by smaller-numbered bits appear first. An instruction needing two masks must first provide the first mask followed by the first mask's additional operands, and then provide the second mask followed by the second mask's additional operands.

This value is a literal mask; it can be formed by combining the bits from multiple rows in the table below.

Used by:

- [OpLoad](#)
- [OpStore](#)
- [OpCopyMemory](#)
- [OpCopyMemorySized](#)
- [OpCooperativeMatrixLoadNV](#)
- [OpCooperativeMatrixStoreNV](#)

Memory Operands		Enabling Capabilities
0x0	<b>None</b>	
0x1	<b>Volatile</b> This access cannot be eliminated, duplicated, or combined with other accesses.	
0x2	<b>Aligned</b> This access has a known alignment. The alignment is specified in a subsequent unsigned 32-bit integer literal operand. Valid values are defined by the execution environment.	
0x4	<b>Nontemporal</b> Hints that the accessed address is not likely to be accessed again in the near future.	
0x8	<b>MakePointerAvailable</b> Perform an availability operation on the locations pointed to by the pointer operand, after a store. A following operand is the <a href="#">scope</a> for the availability operation. Requires <b>NonPrivatePointer</b> to also be set. Not valid with <a href="#">OpLoad</a> .	<b>VulkanMemoryModel</b>  Missing before version 1.5.

Memory Operands		Enabling Capabilities
0x8	<b>MakePointerAvailableKHR</b>	<b>VulkanMemoryModel</b>  Missing before version 1.5.  Also see extension: <b>SPV_KHR_vulkan_memory_model</b>
0x10	<b>MakePointerVisible</b> Perform a visibility operation on the locations pointed to by the pointer operand, before a load. A following operand is the <a href="#">scope</a> for the visibility operation. Requires <b>NonPrivatePointer</b> to also be set. Not valid with <a href="#">OpStore</a> .	<b>VulkanMemoryModel</b>  Missing before version 1.5.
0x10	<b>MakePointerVisibleKHR</b>	<b>VulkanMemoryModel</b>  Missing before version 1.5.  Also see extension: <b>SPV_KHR_vulkan_memory_model</b>
0x20	<b>NonPrivatePointer</b> The memory access obeys inter-thread ordering, as specified by the client API.	<b>VulkanMemoryModel</b>  Missing before version 1.5.
0x20	<b>NonPrivatePointerKHR</b>	<b>VulkanMemoryModel</b>  Missing before version 1.5.  Also see extension: <b>SPV_KHR_vulkan_memory_model</b>

### 3.27 Scope <id>

Must be an <id> of a 32-bit integer scalar. Its value must be one of the values in the table below.

When labeled as a memory scope, it specifies the distance of synchronization from the current [invocation](#). When labeled as an execution scope, it specifies the set of executing invocations taking part in the operation. Other usages (neither memory nor execution) of scope are possible, and each such usage will define what scope means in its context. Used by:

- [OpControlBarrier](#)
- [OpMemoryBarrier](#)
- [OpAtomicLoad](#)
- [OpAtomicStore](#)
- [OpAtomicExchange](#)
- [OpAtomicCompareExchange](#)
- [OpAtomicCompareExchangeWeak](#)
- [OpAtomicIIncrement](#)
- [OpAtomicIDecrement](#)
- [OpAtomicIAdd](#)

- [OpGroupFMaxNonUniformAMD](#)
- [OpGroupUMaxNonUniformAMD](#)
- [OpGroupSMaxNonUniformAMD](#)
- [OpReadClockKHR](#)
- [OpTypeCooperativeMatrixNV](#)

Scope		Enabling Capabilities
0	<b>CrossDevice</b> Scope crosses multiple devices.	
1	<b>Device</b> Scope is the current device.	
2	<b>Workgroup</b> Scope is the current workgroup.	
3	<b>Subgroup</b> Scope is the current subgroup.	
4	<b>Invocation</b> Scope is the current <a href="#">Invocation</a> .	
5	<b>QueueFamily</b> Scope is the current queue family.	<b>VulkanMemoryModel</b>  <a href="#">Missing before version 1.5.</a>
5	<b>QueueFamilyKHR</b>	<b>VulkanMemoryModel</b>  <a href="#">Missing before version 1.5.</a>

### 3.28 Group Operation

Defines the class of workgroup or subgroup operation. Used by:

- [OpGroupIAdd](#)
- [OpGroupFAdd](#)
- [OpGroupFMin](#)
- [OpGroupUMin](#)
- [OpGroupSMin](#)
- [OpGroupFMax](#)
- [OpGroupUMax](#)
- [OpGroupSMax](#)
- [OpGroupNonUniformBallotBitCount](#)
- [OpGroupNonUniformIAdd](#)
- [OpGroupNonUniformFAdd](#)
- [OpGroupNonUniformIMul](#)
- [OpGroupNonUniformFMul](#)
- [OpGroupNonUniformSMin](#)
- [OpGroupNonUniformUMin](#)
- [OpGroupNonUniformFMin](#)
- [OpGroupNonUniformSMax](#)
- [OpGroupNonUniformUMax](#)
- [OpGroupNonUniformFMax](#)
- [OpGroupNonUniformBitwiseAnd](#)
- [OpGroupNonUniformBitwiseOr](#)
- [OpGroupNonUniformBitwiseXor](#)
- [OpGroupNonUniformLogicalAnd](#)
- [OpGroupNonUniformLogicalOr](#)
- [OpGroupNonUniformLogicalXor](#)
- [OpGroupIAddNonUniformAMD](#)
- [OpGroupFAddNonUniformAMD](#)
- [OpGroupFMinNonUniformAMD](#)
- [OpGroupUMinNonUniformAMD](#)
- [OpGroupSMinNonUniformAMD](#)
- [OpGroupFMaxNonUniformAMD](#)
- [OpGroupUMaxNonUniformAMD](#)
- [OpGroupSMaxNonUniformAMD](#)

Group Operation		Enabling Capabilities
0	<b>Reduce</b> A reduction operation for all values of a specific value X specified by <a href="#">invocations</a> within a workgroup.	<b>Kernel, GroupNonUniformArithmetic, GroupNonUniformBallot</b>

Group Operation		Enabling Capabilities
1	<b>InclusiveScan</b> A binary operation with an identity $I$ and $n$ (where $n$ is the size of the workgroup) elements $[a_0, a_1, \dots, a_{n-1}]$ resulting in $[a_0, (a_0 \text{ op } a_1), \dots, (a_0 \text{ op } a_1 \text{ op } \dots \text{ op } a_{n-1})]$	Kernel, GroupNonUniformArithmetic, GroupNonUniformBallot
2	<b>ExclusiveScan</b> A binary operation with an identity $I$ and $n$ (where $n$ is the size of the workgroup) elements $[a_0, a_1, \dots, a_{n-1}]$ resulting in $[I, a_0, (a_0 \text{ op } a_1), \dots, (a_0 \text{ op } a_1 \text{ op } \dots \text{ op } a_{n-2})]$ .	Kernel, GroupNonUniformArithmetic, GroupNonUniformBallot
3	<b>ClusteredReduce</b>	GroupNonUniformClustered  Missing before version 1.3.
6	<b>PartitionedReduceNV</b>	GroupNonUniformPartitionedNV  Reserved.  Also see extension: SPV_NV_shader_subgroup_partitioned
7	<b>PartitionedInclusiveScanNV</b>	GroupNonUniformPartitionedNV  Reserved.  Also see extension: SPV_NV_shader_subgroup_partitioned
8	<b>PartitionedExclusiveScanNV</b>	GroupNonUniformPartitionedNV  Reserved.  Also see extension: SPV_NV_shader_subgroup_partitioned

### 3.29 Kernel Enqueue Flags

Specify when the child kernel begins execution.

**Note:** Implementations are not required to honor this flag. Implementations may not schedule kernel launch earlier than the point specified by this flag, however. Used by [OpEnqueueKernel](#).

Kernel Enqueue Flags		Enabling Capabilities
0	<b>NoWait</b> Indicates that the enqueued kernels do not need to wait for the parent kernel to finish execution before they begin execution.	Kernel
1	<b>WaitKernel</b> Indicates that all work-items of the parent kernel must finish executing and all immediate side effects committed before the enqueued child kernel may begin execution.  <b>Note:</b> Immediate meaning not side effects resulting from child kernels. The side effects would include stores to global memory and pipe reads and writes.	Kernel

Kernel Enqueue Flags		Enabling Capabilities
2	<b>WaitWorkGroup</b> Indicates that the enqueued kernels wait only for the workgroup that enqueued the kernels to finish before they begin execution.  <b>Note:</b> This acts as a memory synchronization point between work-items in a work-group and child kernels enqueued by work-items in the work-group.	Kernel

### 3.30 Kernel Profiling Info

Specify the profiling information to be queried. Used by [OpCaptureEventProfilingInfo](#).

This value is a mask; it can be formed by combining the bits from multiple rows in the table below.

Kernel Profiling Info		Enabling Capabilities
0x0	<b>None</b>	
0x1	<b>CmdExecTime</b> Indicates that the profiling info queried is the execution time.	Kernel

### 3.31 Capability

Capabilities a module can declare it uses.

All used capabilities must be declared, either explicitly with [OpCapability](#) or implicitly through the **Implicitly Declares** column. The **Implicitly Declares** column lists additional capabilities that are all implicitly declared when the **Capability** entry is explicitly or implicitly declared. It is not necessary, but allowed, to explicitly declare an implicitly declared capability.

See the [capabilities](#) section for more detail. Used by [OpCapability](#).

Capability		Implicitly Declares
0	<b>Matrix</b> Uses <a href="#">OpTypeMatrix</a> .	
1	<b>Shader</b> Uses <b>Vertex</b> , <b>Fragment</b> , or <b>GLCompute Execution Models</b> .	Matrix
2	<b>Geometry</b> Uses the <b>Geometry Execution Model</b> .	Shader
3	<b>Tessellation</b> Uses the <b>TessellationControl</b> or <b>TessellationEvaluation Execution Models</b> .	Shader
4	<b>Addresses</b> Uses physical addressing, non-logical addressing modes.	
5	<b>Linkage</b> Uses partially linked modules and libraries.	
6	<b>Kernel</b> Uses the <b>Kernel Execution Model</b> .	
7	<b>Vector16</b> Uses <a href="#">OpTypeVector</a> to declare 8 component or 16 component vectors.	Kernel

Capability		Implicitly Declares
8	<b>Float16Buffer</b> Allows a 16-bit <a href="#">OpTypeFloat</a> instruction for creating an <a href="#">OpTypePointer</a> to a 16-bit float. Pointers to a 16-bit float cannot be dereferenced directly, they must only be dereferenced via an extended instruction. All other uses of 16-bit <b>OpTypeFloat</b> are disallowed.	<b>Kernel</b>
9	<b>Float16</b> Uses <a href="#">OpTypeFloat</a> to declare the 16-bit floating-point type.	
10	<b>Float64</b> Uses <a href="#">OpTypeFloat</a> to declare the 64-bit floating-point type.	
11	<b>Int64</b> Uses <a href="#">OpTypeInt</a> to declare 64-bit integer types.	
12	<b>Int64Atomics</b> Uses atomic instructions on 64-bit integer types.	<b>Int64</b>
13	<b>ImageBasic</b> Uses <a href="#">OpTypeImage</a> or <a href="#">OpTypeSampler</a> in a <b>Kernel</b> .	<b>Kernel</b>
14	<b>ImageReadWrite</b> Uses <a href="#">OpTypeImage</a> with the <b>ReadWrite</b> <a href="#">access qualifier</a> .	<b>ImageBasic</b>
15	<b>ImageMipmap</b> Uses non-zero <b>Lod</b> <a href="#">Image Operands</a> .	<b>ImageBasic</b>
17	<b>Pipes</b> Uses <a href="#">OpTypePipe</a> , <a href="#">OpTypeReserveId</a> or <a href="#">pipe</a> instructions.	<b>Kernel</b>
18	<b>Groups</b> Uses common group instructions.	Also see extension: <b>SPV_AMD_shader_ballot</b>
19	<b>DeviceEnqueue</b> Uses <a href="#">OpTypeQueue</a> , <a href="#">OpTypeDeviceEvent</a> , and <a href="#">device side enqueue</a> instructions.	<b>Kernel</b>
20	<b>LiteralSampler</b> <a href="#">Samplers</a> are made from literals within the module. See <a href="#">OpConstantSampler</a> .	<b>Kernel</b>
21	<b>AtomicStorage</b> Uses the <b>AtomicCounter</b> <a href="#">Storage Class</a> , allowing use of only the <a href="#">OpAtomicLoad</a> , <a href="#">OpAtomicIncrement</a> , and <a href="#">OpAtomicDecrement</a> instructions.	<b>Shader</b>
22	<b>Int16</b> Uses <a href="#">OpTypeInt</a> to declare 16-bit integer types.	
23	<b>TessellationPointSize</b> Tessellation stage exports point size.	<b>Tessellation</b>
24	<b>GeometryPointSize</b> Geometry stage exports point size	<b>Geometry</b>
25	<b>ImageGatherExtended</b> Uses texture gather with non-constant or independent offsets	<b>Shader</b>
27	<b>StorageImageMultisample</b> Uses multi-sample images for non-sampled images.	<b>Shader</b>
28	<b>UniformBufferArrayDynamicIndexing</b> <b>Block</b> -decorated arrays in uniform storage classes use <a href="#">dynamically uniform</a> indexing.	<b>Shader</b>

	Capability	Implicitly Declares
29	<b>SampledImageArrayDynamicIndexing</b> Arrays of sampled images use <a href="#">dynamically uniform</a> indexing.	Shader
30	<b>StorageBufferArrayDynamicIndexing</b> Arrays in the <b>StorageBuffer</b> <a href="#">Storage Class</a> , or <b>BufferBlock</b> -decorated arrays, use <a href="#">dynamically uniform</a> indexing.	Shader
31	<b>StorageImageArrayDynamicIndexing</b> Arrays of non-sampled images are accessed with <a href="#">dynamically uniform</a> indexing.	Shader
32	<b>ClipDistance</b> Uses the <b>ClipDistance</b> <a href="#">BuiltIn</a> .	Shader
33	<b>CullDistance</b> Uses the <b>CullDistance</b> <a href="#">BuiltIn</a> .	Shader
34	<b>ImageCubeArray</b> Uses the <b>Cube Dim</b> with the <i>Arrayed</i> operand in <a href="#">OpTypeImage</a> , without a <a href="#">sampler</a> .	SampledCubeArray
35	<b>SampleRateShading</b> Uses per-sample rate shading.	Shader
36	<b>ImageRect</b> Uses the <b>Rect Dim</b> without a <a href="#">sampler</a> .	SampledRect
37	<b>SampledRect</b> Uses the <b>Rect Dim</b> with a <a href="#">sampler</a> .	Shader
38	<b>GenericPointer</b> Uses the <b>Generic</b> <a href="#">Storage Class</a> .	Addresses
39	<b>Int8</b> Uses <a href="#">OpTypeInt</a> to declare 8-bit integer types.	
40	<b>InputAttachment</b> Uses the <b>SubpassData Dim</b> .	Shader
41	<b>SparseResidency</b> Uses <b>OpImageSparse...</b> instructions.	Shader
42	<b>MinLod</b> Uses the <b>MinLod</b> <a href="#">Image Operand</a> .	Shader
43	<b>Sampled1D</b> Uses the <b>1D Dim</b> with a <a href="#">sampler</a> .	
44	<b>Image1D</b> Uses the <b>1D Dim</b> without a <a href="#">sampler</a> .	Sampled1D
45	<b>SampledCubeArray</b> Uses the <b>Cube Dim</b> with the <i>Arrayed</i> operand in <a href="#">OpTypeImage</a> , with a <a href="#">sampler</a> .	Shader
46	<b>SampledBuffer</b> Uses the <b>Buffer Dim</b> with a <a href="#">sampler</a> .	
47	<b>ImageBuffer</b> Uses the <b>Buffer Dim</b> without a <a href="#">sampler</a> .	SampledBuffer
48	<b>ImageMSArray</b> An <i>MS</i> operand in <a href="#">OpTypeImage</a> indicates multisampled, used without a <a href="#">sampler</a> .	Shader
49	<b>StorageImageExtendedFormats</b> One of a large set of more advanced image formats are used, namely one of those in the <a href="#">Image Format</a> table listed as requiring this capability.	Shader
50	<b>ImageQuery</b> The sizes, number of samples, or lod, etc. are queried.	Shader

Capability		Implicitly Declares
51	<b>DerivativeControl</b> Uses fine or coarse-grained derivatives, e.g., <a href="#">OpDPdxFine</a> .	Shader
52	<b>InterpolationFunction</b> Uses one of the <b>InterpolateAtCentroid</b> , <b>InterpolateAtSample</b> , or <b>InterpolateAtOffset</b> GLSL.std.450 extended instructions.	Shader
53	<b>TransformFeedback</b> Uses the <b>Xfb Execution Mode</b> .	Shader
54	<b>GeometryStreams</b> Uses multiple numbered streams for geometry-stage output.	Geometry
55	<b>StorageImageReadWithoutFormat</b> <a href="#">OpImageRead</a> can use the <b>Unknown Image Format</b> .	Shader
56	<b>StorageImageWriteWithoutFormat</b> <a href="#">OpImageWrite</a> can use the <b>Unknown Image Format</b> .	Shader
57	<b>MultiViewport</b> Multiple viewports are used.	Geometry
58	<b>SubgroupDispatch</b> Uses subgroup dispatch instructions.	DeviceEnqueue  <a href="#">Missing before version 1.1.</a>
59	<b>NamedBarrier</b> Uses <a href="#">OpTypeNamedBarrier</a> .	Kernel  <a href="#">Missing before version 1.1.</a>
60	<b>PipeStorage</b> Uses <a href="#">OpTypePipeStorage</a> .	Pipes  <a href="#">Missing before version 1.1.</a>
61	<b>GroupNonUniform</b>	<a href="#">Missing before version 1.3.</a>
62	<b>GroupNonUniformVote</b>	GroupNonUniform  <a href="#">Missing before version 1.3.</a>
63	<b>GroupNonUniformArithmetic</b>	GroupNonUniform  <a href="#">Missing before version 1.3.</a>
64	<b>GroupNonUniformBallot</b>	GroupNonUniform  <a href="#">Missing before version 1.3.</a>
65	<b>GroupNonUniformShuffle</b>	GroupNonUniform  <a href="#">Missing before version 1.3.</a>
66	<b>GroupNonUniformShuffleRelative</b>	GroupNonUniform  <a href="#">Missing before version 1.3.</a>
67	<b>GroupNonUniformClustered</b>	GroupNonUniform  <a href="#">Missing before version 1.3.</a>
68	<b>GroupNonUniformQuad</b>	GroupNonUniform  <a href="#">Missing before version 1.3.</a>
69	<b>ShaderLayer</b>	<a href="#">Missing before version 1.5.</a>
70	<b>ShaderViewportIndex</b>	<a href="#">Missing before version 1.5.</a>
4423	<b>SubgroupBallotKHR</b>	<a href="#">Reserved.</a>  Also see extension: <b>SPV_KHR_shader_ballot</b>

Capability	Implicitly Declares
4427 <b>DrawParameters</b>	<b>Shader</b>  Missing before version 1.3.  Also see extension: <b>SPV_KHR_shader_draw_parameters</b>
4431 <b>SubgroupVoteKHR</b>	<b>Reserved.</b>  Also see extension: <b>SPV_KHR_subgroup_vote</b>
4433 <b>StorageBuffer16BitAccess</b> Uses 16-bit <a href="#">OpTypeFloat</a> and <a href="#">OpTypeInt</a> instructions for creating scalar, vector, and composite types that become members of a block residing in the <b>StorageBuffer storage class</b> , the <b>PhysicalStorageBuffer storage class</b> , or the <b>Uniform storage class</b> with the <b>BufferBlock decoration</b> .	Missing before version 1.3.  Also see extension: <b>SPV_KHR_16bit_storage</b>
4433 <b>StorageUniformBufferBlock16</b>	Missing before version 1.3.  Also see extension: <b>SPV_KHR_16bit_storage</b>
4434 <b>UniformAndStorageBuffer16BitAccess</b> Uses 16-bit <a href="#">OpTypeFloat</a> and <a href="#">OpTypeInt</a> instructions for creating scalar, vector, and composite types that become members of a block residing in the <b>StorageBuffer storage class</b> , the <b>PhysicalStorageBuffer storage class</b> , or the <b>Uniform storage class</b> .	<b>StorageBuffer16BitAccess</b> , <b>StorageUniformBufferBlock16</b>  Missing before version 1.3.  Also see extension: <b>SPV_KHR_16bit_storage</b>
4434 <b>StorageUniform16</b>	<b>StorageBuffer16BitAccess</b> , <b>StorageUniformBufferBlock16</b>  Missing before version 1.3.  Also see extension: <b>SPV_KHR_16bit_storage</b>
4435 <b>StoragePushConstant16</b> Uses 16-bit <a href="#">OpTypeFloat</a> and <a href="#">OpTypeInt</a> instructions for creating scalar, vector, and composite types that become members of a block residing in the <b>PushConstant storage class</b> .	Missing before version 1.3.  Also see extension: <b>SPV_KHR_16bit_storage</b>
4436 <b>StorageInputOutput16</b> Uses 16-bit <a href="#">OpTypeFloat</a> and <a href="#">OpTypeInt</a> instructions for creating scalar, vector, and composite types that become members of a block residing in the <b>Output storage class</b> .	Missing before version 1.3.  Also see extension: <b>SPV_KHR_16bit_storage</b>
4437 <b>DeviceGroup</b>	Missing before version 1.3.  Also see extension: <b>SPV_KHR_device_group</b>
4439 <b>MultiView</b>	<b>Shader</b>  Missing before version 1.3.  Also see extension: <b>SPV_KHR_multiview</b>

	Capability	Implicitly Declares
4441	<b>VariablePointersStorageBuffer</b> Allow <a href="#">variable pointers</a> , each confined to a single <b>Block</b> -decorated struct in the <b>StorageBuffer</b> storage class.	<b>Shader</b>  <a href="#">Missing before version 1.3.</a>  Also see extension: <b>SPV_KHR_variable_pointers</b>
4442	<b>VariablePointers</b> Allow <a href="#">variable pointers</a> .	<b>VariablePointersStorageBuffer</b>  <a href="#">Missing before version 1.3.</a>  Also see extension: <b>SPV_KHR_variable_pointers</b>
4445	<b>AtomicStorageOps</b>	<a href="#">Reserved.</a>  Also see extension: <b>SPV_KHR_shader_atomic_counter_ops</b>
4447	<b>SampleMaskPostDepthCoverage</b>	<a href="#">Reserved.</a>  Also see extension: <b>SPV_KHR_post_depth_coverage</b>
4448	<b>StorageBuffer8BitAccess</b> Uses 8-bit <a href="#">OpTypeInt</a> instructions for creating scalar, vector, and composite types that become members of a block residing in the <b>StorageBuffer</b> <a href="#">storage class</a> or the <b>PhysicalStorageBuffer</b> storage class.	<a href="#">Missing before version 1.5.</a>  Also see extension: <b>SPV_KHR_8bit_storage</b>
4449	<b>UniformAndStorageBuffer8BitAccess</b> Uses 8-bit <a href="#">OpTypeInt</a> instructions for creating scalar, vector, and composite types that become members of a block residing in the <b>StorageBuffer</b> <a href="#">storage class</a> , the <b>PhysicalStorageBuffer</b> storage class, or the <b>Uniform</b> storage class.	<b>StorageBuffer8BitAccess</b>  <a href="#">Missing before version 1.5.</a>  Also see extension: <b>SPV_KHR_8bit_storage</b>
4450	<b>StoragePushConstant8</b> Uses 8-bit <a href="#">OpTypeInt</a> instructions for creating scalar, vector, and composite types that become members of a block residing in the <b>PushConstant</b> <a href="#">storage class</a> .	<a href="#">Missing before version 1.5.</a>  Also see extension: <b>SPV_KHR_8bit_storage</b>
4464	<b>DenormPreserve</b> Uses the <b>DenormPreserve</b> <a href="#">execution mode</a> .	<a href="#">Missing before version 1.4.</a>  Also see extension: <b>SPV_KHR_float_controls</b>
4465	<b>DenormFlushToZero</b> Uses the <b>DenormFlushToZero</b> <a href="#">execution mode</a> .	<a href="#">Missing before version 1.4.</a>  Also see extension: <b>SPV_KHR_float_controls</b>
4466	<b>SignedZeroInfNanPreserve</b> Uses the <b>SignedZeroInfNanPreserve</b> <a href="#">execution mode</a> .	<a href="#">Missing before version 1.4.</a>  Also see extension: <b>SPV_KHR_float_controls</b>
4467	<b>RoundingModeRTE</b> Uses the <b>RoundingModeRTE</b> <a href="#">execution mode</a> .	<a href="#">Missing before version 1.4.</a>  Also see extension: <b>SPV_KHR_float_controls</b>
4468	<b>RoundingModeRTZ</b> Uses the <b>RoundingModeRTZ</b> <a href="#">execution mode</a> .	<a href="#">Missing before version 1.4.</a>  Also see extension: <b>SPV_KHR_float_controls</b>
5008	<b>Float16ImageAMD</b>	<b>Shader</b>  <a href="#">Reserved.</a>  Also see extension: <b>SPV_AMD_gpu_shader_half_float_fetch</b>

### 3.32 Instructions

Form for each instruction:

<b>Opcode Name</b> (name-alias, name-alias, ...)  Instruction description.  <i>Word Count</i> is the high-order 16 bits of word 0 of the instruction, holding its total <a href="#">WordCount</a> . If the instruction takes a variable number of operands, <i>Word Count</i> will also say "+ variable", after stating the minimum size of the instruction.  <i>Opcode</i> is the low-order 16 bits of word 0 of the instruction, holding its opcode enumerant.  <i>Results</i> , when present, are any <a href="#">Result &lt;id&gt;</a> or <i>Result Type</i> created by the instruction. Each <i>Result &lt;id&gt;</i> is always 32 bits.  <i>Operands</i> , when present, are any literals, other instruction's <i>Result &lt;id&gt;</i> , etc., consumed by the instruction. Each operand is always 32 bits.			<a href="#">Capability Enabling Capabilities</a> (when needed)
<a href="#">Word Count</a>	<i>Opcode</i>	<i>Results</i>	<i>Operands</i>

#### 3.32.1 Miscellaneous Instructions

<b>OpNop</b>	
This has no semantic impact and can safely be removed from a module.	
1	0

<b>OpUndef</b>			
Make an <a href="#">intermediate</a> object whose value is undefined.			
<i>Result Type</i> is the type of object to make.			
Each consumption of <i>Result &lt;id&gt;</i> yields an arbitrary, possibly different bit pattern or abstract value resulting in possibly different concrete, abstract, or opaque values.			
3	1	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>

<b>OpSizeOf</b>  Computes the run-time size of the type pointed to by <i>Pointer</i>  <i>Result Type</i> must be a 32-bit integer type scalar.  <i>Pointer</i> must point to a concrete type.			<b>Capability:</b> <b>Addresses</b>  Missing before version 1.1.	
4	321	<id> <i>Result Type</i>	Result <id>	<id> <i>Pointer</i>

### 3.32.2 Debug Instructions

#### OpSourceContinued

Continue specifying the *Source* text from the previous instruction. This has no semantic impact and can safely be removed from a module.

*Continued Source* is a continuation of the source text in the previous *Source*.

The previous instruction must be an [OpSource](#) or an **OpSourceContinued** instruction. As is true for all literal strings, the previous instruction's string was nul terminated. That terminating nul from the previous instruction is not part of the source text; the first character of *Continued Source* logically immediately follows the last character of *Source* before its nul.

2 + variable	2	<a href="#">Literal</a> <i>Continued Source</i>
--------------	---	--

#### OpSource

Document what [source language](#) and text this module was translated from. This has no semantic impact and can safely be removed from a module.

*Version* is the version of the source language. It is an unsigned 32-bit integer.

*File* is an [OpString](#) instruction and is the source-level file name.

*Source* is the text of the source-level file.

Each client API specifies what form the *Version* operand takes, per source language.

3 + variable	3	<a href="#">Source Language</a>	<a href="#">Literal</a> <i>Version</i>	Optional <id> <i>File</i>	Optional <a href="#">Literal</a> <i>Source</i>
--------------	---	---------------------------------	---	---------------------------------	--

#### OpSourceExtension

Document an extension to the source language. This has no semantic impact and can safely be removed from a module.

*Extension* is a string describing a source-language extension. Its form is dependent on the how the source language describes extensions.

2 + variable	4	<a href="#">Literal</a> <i>Extension</i>
--------------	---	---

**OpName**

Assign a name string to another instruction's *Result <id>*. This has no semantic impact and can safely be removed from a module.

*Target* is the *Result <id>* to assign a name to. It can be the *Result <id>* of any other instruction; a variable, function, type, intermediate result, etc.

*Name* is the string to assign.

3 + variable	5	<i>&lt;id&gt;</i> <i>Target</i>	<a href="#">Literal</a> <i>Name</i>
--------------	---	------------------------------------	--

**OpMemberName**

Assign a name string to a member of a structure type. This has no semantic impact and can safely be removed from a module.

*Type* is the *<id>* from an [OpTypeStruct](#) instruction.

*Member* is the number of the member to assign in the structure. The first member is member 0, the next is member 1, ... *Member* is an unsigned 32-bit integer.

*Name* is the string to assign to the member.

4 + variable	6	<i>&lt;id&gt;</i> <i>Type</i>	<a href="#">Literal</a> <i>Member</i>	<a href="#">Literal</a> <i>Name</i>
--------------	---	----------------------------------	--	--

**OpString**

Assign a *Result <id>* to a string for use by other debug instructions (see [OpLine](#) and [OpSource](#)). This has no semantic impact and can safely be removed from a module. (Removal also requires removal of all instructions referencing *Result <id>*.)

*String* is the string being assigned a *Result <id>*.

3 + variable	7	<a href="#">Result &lt;id&gt;</a>	<a href="#">Literal</a> <i>String</i>
--------------	---	-----------------------------------	--

**OpLine**

Add source-level location information. This has no semantic impact and can safely be removed from a module.

This location information applies to the instructions physically following this instruction, up to the first occurrence of any of the following: the next end of block, the next **OpLine** instruction, or the next **OpNoLine** instruction.

*File* must be an **OpString** instruction and is the source-level file name.

*Line* is the source-level line number. *Line* is an unsigned 32-bit integer.

*Column* is the source-level column number. *Column* is an unsigned 32-bit integer.

**OpLine** can generally immediately precede other instructions, with the following exceptions:

- it may not be used until after the **annotation** instructions, (see the **Logical Layout** section)
- cannot be the last instruction in a block, which is defined to end with a **termination instruction**
- if a branch **merge instruction** is used, the last **OpLine** in the block must be before its merge instruction

4	8	<id> <i>File</i>	<b>Literal</b> <i>Line</i>	<b>Literal</b> <i>Column</i>
---	---	---------------------	-------------------------------	---------------------------------

**OpNoLine**

Discontinue any source-level location information that might be active from a previous **OpLine** instruction. This has no semantic impact and can safely be removed from a module.

This instruction can only appear after the **annotation** instructions (see the **Logical Layout** section). It cannot be the last instruction in a block, or the second-to-last instruction if the block has a **merge instruction**. There is not a requirement that there is a preceding **OpLine** instruction.

1	317
---	-----

**OpModuleProcessed**

Document a process that was applied to a module. This has no semantic impact and can safely be removed from a module.

*Process* is a string describing a process and/or tool (processor) that did the processing. Its form is dependent on the processor.

**Missing before version 1.1.**

2 + variable	330	<b>Literal</b> <i>Process</i>
--------------	-----	----------------------------------

## 3.32.3 Annotation Instructions

**OpDecorate**

Add a [Decoration](#) to another *<id>*.

*Target* is the *<id>* to decorate. It can potentially be any *<id>* that is a forward reference. A set of decorations can be grouped together by having multiple decoration instructions targeting the same [OpDecorationGroup](#) instruction.

This instruction is only valid when the *Decoration* operand is a [decoration](#) that takes no **Extra Operands**, or takes **Extra Operands** that are not *<id>* operands.

3 + variable	71	<i>&lt;id&gt;</i> <i>Target</i>	<a href="#">Decoration</a>	<i>Literal, Literal, ...</i> See <a href="#">Decoration</a> .
--------------	----	------------------------------------	----------------------------	--

**OpMemberDecorate**

Add a [Decoration](#) to a member of a structure type.

*Structure type* is the *<id>* of a type from [OpTypeStruct](#).

*Member* is the number of the member to decorate in the type. The first member is member 0, the next is member 1, ...

Note: See **OpDecorate** for creating groups of decorations for consumption by **OpGroupMemberDecorate**

4 + variable	72	<i>&lt;id&gt;</i> <i>Structure Type</i>	<a href="#">Literal</a> <i>Member</i>	<a href="#">Decoration</a>	<i>Literal, Literal, ...</i> See <a href="#">Decoration</a> .
--------------	----	--	--	----------------------------	--

**OpDecorationGroup**

[Deprecated](#) (directly use non-group decoration instructions instead).

A collector for [Decorations](#) from [OpDecorate](#) and [OpDecorateId](#) instructions. All such decoration instructions targeting this **OpDecorationGroup** instruction must precede it. Subsequent [OpGroupDecorate](#) and [OpGroupMemberDecorate](#) instructions that consume this instruction's *Result <id>* will apply these decorations to their targets.

2	73	<a href="#">Result &lt;id&gt;</a>
---	----	-----------------------------------

**OpGroupDecorate**

[Deprecated](#) (directly use non-group decoration instructions instead).

Add a group of [Decorations](#) to another *<id>*.

*Decoration Group* is the *<id>* of an [OpDecorationGroup](#) instruction.

*Targets* is a list of *<id>*s to decorate with the groups of decorations. The *Targets* list must not include the *<id>* of any [OpDecorationGroup](#) instruction.

2 + variable	74	<i>&lt;id&gt;</i> <i>Decoration Group</i>	<i>&lt;id&gt;, &lt;id&gt;, ...</i> <i>Targets</i>
--------------	----	--	--

**OpGroupMemberDecorate**

**Deprecated** (directly use non-group decoration instructions instead).

Add a group of [Decorations](#) to members of structure types.

*Decoration Group* is the *<id>* of an [OpDecorationGroup](#) instruction.

*Targets* is a list of (*<id>*, *Member*) pairs to decorate with the groups of decorations. Each *<id>* in the pair must be a target structure type, and the associated *Member* is the number of the member to decorate in the type. The first member is member 0, the next is member 1, ...

2 + variable	75	<i>&lt;id&gt;</i> <i>Decoration Group</i>	<i>&lt;id&gt;</i> , <i>literal</i> , <i>&lt;id&gt;</i> , <i>literal</i> , ... <i>Targets</i>
--------------	----	--	---

**OpDecorateId**

Add a [Decoration](#) to another *<id>*, using *<id>*s as **Extra Operands**.

*Target* is the *<id>* to decorate. It can potentially be any *<id>* that is a forward reference. A set of decorations can be grouped together by having multiple decoration instructions targeting the same [OpDecorationGroup](#) instruction.

This instruction is only valid when the *Decoration* operand is a [decoration](#) that takes **Extra Operands** that are *<id>* operands. All such *<id>* **Extra Operands** must be [constant instructions](#) or [OpVariable](#) instructions.

**Missing before version 1.2.**

3 + variable	332	<i>&lt;id&gt;</i> <i>Target</i>	<a href="#">Decoration</a>	<i>&lt;id&gt;</i> , <i>&lt;id&gt;</i> , ... See <a href="#">Decoration</a> .
--------------	-----	------------------------------------	----------------------------	---

**OpDecorateString (OpDecorateStringGOOGLE)**

Add a string [Decoration](#) to another *<id>*.

*Target* is the *<id>* to decorate. It can potentially be any *<id>* that is a forward reference, except it must not be the *<id>* of an [OpDecorationGroup](#).

*Decoration* is a [decoration](#) that takes at least one *Literal* operand, and has only *Literal* string operands.

**Missing before version 1.4.**

4 + variable	5632	<i>&lt;id&gt;</i> <i>Target</i>	<a href="#">Decoration</a>	<a href="#">Literal</a> See <a href="#">Decoration</a> .	<i>Optional Literals</i> See <a href="#">Decoration</a> .
--------------	------	------------------------------------	----------------------------	---	--

<b>OpMemberDecorateString (OpMemberDecorateStringGOOGLE)</b>  Add a string <a href="#">Decoration</a> to a member of a structure type.  <i>Structure Type</i> is the <i>&lt;id&gt;</i> of an <a href="#">OpTypeStruct</a> .  <i>Member</i> is the number of the member to decorate in the type. <i>Member</i> is an unsigned 32-bit integer. The first member is member 0, the next is member 1, ...  <i>Decoration</i> is a <a href="#">decoration</a> that takes at least one <i>Literal</i> operand, and has only <i>Literal</i> string operands.					Missing before version 1.4.	
5 + variable	5633	<i>&lt;id&gt;</i> <i>Struct Type</i>	<a href="#">Literal</a> <i>Member</i>	<a href="#">Decoration</a>	<a href="#">Literal</a> See <a href="#">Decoration</a> .	<i>Optional</i> <a href="#">Literals</a> See <a href="#">Decoration</a> .

### 3.32.4 Extension Instructions

#### OpExtension

Declare use of an extension to SPIR-V. This allows validation of additional instructions, tokens, semantics, etc.

*Name* is the extension's name string.

2 + variable	10	<a href="#">Literal</a> <i>Name</i>
--------------	----	--

#### OpExtInstImport

Import an extended set of instructions. It can be later referenced by the *Result <id>*.

*Name* is the extended instruction-set's name string. There must be an external specification defining the semantics for this extended instruction set.

See [Extended Instruction Sets](#) for more information.

3 + variable	11	<a href="#">Result &lt;id&gt;</a>	<a href="#">Literal</a> <i>Name</i>
--------------	----	-----------------------------------	--

#### OpExtInst

Execute an instruction in an imported set of extended instructions.

*Result Type* is as defined, per *Instruction*, in the external specification for *Set*.

*Set* is the result of an [OpExtInstImport](#) instruction.

*Instruction* is the enumerant of the instruction to execute within *Set*. It is an unsigned 32-bit integer. The semantics of the instruction must be defined in the external specification for *Set*.

*Operand 1, ...* are the operands to the extended instruction.

5 + variable	12	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<i>&lt;id&gt;</i> <i>Set</i>	<a href="#">Literal</a> <i>Instruction</i>	<i>&lt;id&gt;, &lt;id&gt;, ...</i> <i>Operand 1,</i> <i>Operand 2,</i> <i>...</i>
--------------	----	---	-----------------------------------	---------------------------------	---	--

### 3.32.5 Mode-Setting Instructions

#### OpMemoryModel

Set addressing model and memory model for the entire module.

*Addressing Model* selects the module's [Addressing Model](#).

*Memory Model* selects the module's memory model, see [Memory Model](#).

3	14	<a href="#">Addressing Model</a>	<a href="#">Memory Model</a>
---	----	----------------------------------	------------------------------

#### OpEntryPoint

Declare an [entry point](#), its execution model, and its interface.

*Execution Model* is the execution model for the entry point and its static call tree. See [Execution Model](#).

*Entry Point* must be the *Result* *<id>* of an [OpFunction](#) instruction.

*Name* is a name string for the entry point. A module cannot have two **OpEntryPoint** instructions with the same [Execution Model](#) and the same *Name* string.

*Interface* is a list of *<id>* of global [OpVariable](#) instructions. These declare the set of global variables from a module that form the interface of this entry point. The set of *Interface* *<id>* must be equal to or a superset of the global **OpVariable** *Result* *<id>* referenced by the entry point's static call tree, within the interface's storage classes. Before **version 1.4**, the interface's storage classes are limited to the **Input** and **Output** storage classes. Starting with **version 1.4**, the interface's storage classes are all [storage classes](#) used in declaring all global variables referenced by the entry point's call tree.

*Interface* *<id>* are forward references. Before **version 1.4**, duplication of these *<id>* is tolerated. Starting with **version 1.4**, an *<id>* must not appear more than once.

4 + variable	15	<a href="#">Execution Model</a>	<i>&lt;id&gt;</i> <i>Entry Point</i>	<a href="#">Literal</a> <i>Name</i>	<i>&lt;id&gt;</i> , <i>&lt;id&gt;</i> , ... <i>Interface</i>
--------------	----	---------------------------------	---	--	---

#### OpExecutionMode

Declare an execution mode for an entry point.

*Entry Point* must be the *Entry Point* *<id>* operand of an [OpEntryPoint](#) instruction.

*Mode* is the execution mode. See [Execution Mode](#).

This instruction is only valid when the *Mode* operand is an [execution mode](#) that takes no **Extra Operands**, or takes **Extra Operands** that are not *<id>* operands.

3 + variable	16	<i>&lt;id&gt;</i> <i>Entry Point</i>	<a href="#">Execution Mode</a> <i>Mode</i>	<i>Literal</i> , <i>Literal</i> , ... See <a href="#">Execution Mode</a>
--------------	----	---	---	---

<b>OpCapability</b>  Declare a capability used by this module.  <i>Capability</i> is the <a href="#">capability</a> declared by this instruction. There are no restrictions on the order in which capabilities are declared.  See the <a href="#">capabilities section</a> for more detail.		
2	17	<a href="#">Capability</a> <i>Capability</i>

<b>OpExecutionModeId</b>  Declare an execution mode for an entry point, using <i>&lt;id&gt;s</i> as <b>Extra Operands</b> .  <i>Entry Point</i> must be the <i>Entry Point &lt;id&gt;</i> operand of an <a href="#">OpEntryPoint</a> instruction.  <i>Mode</i> is the execution mode. See <a href="#">Execution Mode</a> .  This instruction is only valid when the <i>Mode</i> operand is an <a href="#">execution mode</a> that takes <b>Extra Operands</b> that are <i>&lt;id&gt;</i> operands. All such <i>&lt;id&gt;</i> <b>Extra Operands</b> must be <a href="#">constant instructions</a> .			<a href="#">Missing before version 1.2.</a>	
3 + variable	331	<i>&lt;id&gt;</i> <i>Entry Point</i>	<a href="#">Execution Mode</a> <i>Mode</i>	<i>&lt;id&gt;</i> , <i>&lt;id&gt;</i> , ... See <a href="#">Execution Mode</a>

## 3.32.6 Type-Declaration Instructions

<b>OpTypeVoid</b>		
Declare the void type.		
2	19	Result <id>

<b>OpTypeBool</b>		
<p>Declare the <a href="#">Boolean type</a>. Values of this type can only be either <b>true</b> or <b>false</b>. There is no physical size or bit pattern defined for these values. If they are stored (in conjunction with <a href="#">OpVariable</a>), they can only be used with logical addressing operations, not physical, and only with non-externally visible shader <a href="#">Storage Classes</a>: <b>Workgroup</b>, <b>CrossWorkgroup</b>, <b>Private</b>, <b>Function</b>, <b>Input</b>, and <b>Output</b>.</p>		
2	20	Result <id>

<b>OpTypeInt</b>				
<p>Declare a new <a href="#">integer type</a>.</p> <p><i>Width</i> specifies how many bits wide the type is. <i>Width</i> is an unsigned 32-bit integer. The bit pattern of a signed integer value is two's complement.</p> <p><i>Signedness</i> specifies whether there are signed semantics to preserve or validate.</p> <p>0 indicates unsigned, or no signedness semantics</p> <p>1 indicates signed semantics.</p> <p>In all cases, the type of operation of an instruction comes from the instruction's opcode, not the signedness of the operands.</p>				
4	21	Result <id>	Literal <i>Width</i>	Literal <i>Signedness</i>

<b>OpTypeFloat</b>			
<p>Declare a new <a href="#">floating-point type</a>.</p> <p><i>Width</i> specifies how many bits wide the type is. <i>Width</i> is an unsigned 32-bit integer. The bit pattern of a floating-point value is as described by the IEEE 754 standard.</p>			
3	22	Result <id>	Literal <i>Width</i>

<b>OpTypeVector</b>  Declare a new <a href="#">vector type</a> .  <i>Component Type</i> is the type of each component in the resulting type. It must be a <a href="#">scalar type</a> .  <i>Component Count</i> is the number of components in the resulting type. <i>Component Count</i> is an unsigned 32-bit integer. It must be at least 2.  Components are numbered consecutively, starting with 0.				
4	23	<a href="#">Result &lt;id&gt;</a>	<id> <i>Component Type</i>	<a href="#">Literal</a> <i>Component Count</i>

<b>OpTypeMatrix</b>  Declare a new matrix type.  <i>Column Type</i> is the type of each column in the matrix. It must be vector type.  <i>Column Count</i> is the number of columns in the new matrix type. <i>Column Count</i> is an unsigned 32-bit integer. It must be at least 2.  Matrix columns are numbered consecutively, starting with 0. This is true independently of any <a href="#">Decorations</a> describing the memory layout of a matrix (e.g., <b>RowMajor</b> or <b>MatrixStride</b> ).			<a href="#">Capability:</a> <b>Matrix</b>	
4	24	<a href="#">Result &lt;id&gt;</a>	<id> <i>Column Type</i>	<a href="#">Literal</a> <i>Column Count</i>

**OpTypeImage**

Declare a new [image](#) type. Consumed, for example, by [OpTypeSampledImage](#). This type is opaque: values of this type have no defined physical size or bit pattern.

*Sampled Type* is the type of the components that result from sampling or reading from this image type. Must be a scalar [numerical type](#) or [OpTypeVoid](#).

*Dim* is the image [dimensionality](#) (Dim).

All the following literals are integers taking one operand each.

*Depth* is whether or not this image is a depth image. (Note that whether or not depth comparisons are actually done is a property of the sampling opcode, not of this type declaration.)

0 indicates not a depth image

1 indicates a depth image

2 means no indication as to whether this is a depth or non-depth image

*Arrayed* must be one of the following indicated values:

0 indicates non-arrayed content

1 indicates arrayed content

*MS* must be one of the following indicated values:

0 indicates single-sampled content

1 indicates multisampled content

*Sampled* indicates whether or not this image will be accessed in combination with a [sampler](#), and must be one of the following values:

0 indicates this is only known at run time, not at compile time

1 indicates will be used with sampler

2 indicates will be used without a sampler (a storage image)

*Image Format* is the [Image Format](#), which can be **Unknown**, as specified by the client API.

If *Dim* is **SubpassData**, *Sampled* must be 2, *Image Format* must be **Unknown**, and the [Execution Model](#) must be **Fragment**.

*Access Qualifier* is an image [Access Qualifier](#).

9 + variable	25	<a href="#">Result</a> <a href="#">&lt;id&gt;</a>	<a href="#">&lt;id&gt;</a> <i>Sampled Type</i>	<a href="#">Dim</a>	<a href="#">Literal</a> <i>Depth</i>	<a href="#">Literal</a> <i>Arrayed</i>	<a href="#">Literal</a> <i>MS</i>	<a href="#">Literal</a> <i>Sampled</i>	<a href="#">Image</a> <a href="#">Format</a>	Optional <a href="#">Access</a> <a href="#">Qualifier</a>
-----------------	----	--	---	---------------------	---	---	--------------------------------------	---	---	---

**OpTypeSampler**

Declare the [sampler](#) type. Consumed by [OpSampledImage](#). This type is opaque: values of this type have no defined physical size or bit pattern.

2	26	<a href="#">Result</a> <a href="#">&lt;id&gt;</a>
---	----	---

**OpTypeSampledImage**

Declare a [sampled image](#) type, the *Result Type* of [OpSampledImage](#), or an externally combined sampler and image. This type is opaque: values of this type have no defined physical size or bit pattern.

*Image Type* must be an [OpTypeImage](#). It is the type of the image in the combined sampler and image type.

3	27	Result <id>	<id> <i>Image Type</i>
---	----	-------------	---------------------------

**OpTypeArray**

Declare a new [array](#) type.

*Element Type* is the type of each element in the array.

*Length* is the number of elements in the array. It must be at least 1. *Length* must come from a [constant instruction](#) of an [integer-type](#) scalar whose value is at least 1.

Array elements are numbered consecutively, starting with 0.

4	28	Result <id>	<id> <i>Element Type</i>	<id> <i>Length</i>
---	----	-------------	-----------------------------	-----------------------

**OpTypeRuntimeArray**

Declare a new run-time array type. Its length is not known at compile time.

*Element Type* is the type of each element in the array. It must be a [concrete](#) type.

See [OpArrayLength](#) for getting the *Length* of an array of this type.

[Capability:](#)  
**Shader**

3	29	Result <id>	<id> <i>Element Type</i>
---	----	-------------	-----------------------------

**OpTypeStruct**

Declare a new [structure](#) type.

*Member N type* is the type of member *N* of the structure. The first member is member 0, the next is member 1, ... It is valid for the structure to have no members.

If an operand is not yet defined, it must be defined by an [OpTypePointer](#), where the type pointed to is an **OpTypeStruct**.

2 + variable	30	Result <id>	<id>, <id>, ... <i>Member 0 type,</i> <i>member 1 type,</i> ...
--------------	----	-------------	--

<b>OpTypeOpaque</b>			<b>Capability:</b> <b>Kernel</b>
Declare a structure type with no body specified.			
3 + variable	31	Result <id>	<b>Literal</b> The name of the opaque type.

<b>OpTypePointer</b>				
Declare a new pointer type.				
<p><i>Storage Class</i> is the <a href="#">Storage Class</a> of the memory holding the object pointed to. If there was a forward reference to this type from an <a href="#">OpTypeForwardPointer</a>, the <i>Storage Class</i> of that instruction must equal the <i>Storage Class</i> of this instruction.</p> <p><i>Type</i> is the type of the object pointed to.</p>				
4	32	Result <id>	Storage Class	<id> <i>Type</i>

<b>OpTypeFunction</b>				
Declare a new function type.				
<a href="#">OpFunction</a> will use this to declare the return type and parameter types of a function.				
<p><i>Return Type</i> is the type of the return value of functions of this type. It must be a <a href="#">concrete</a> or <a href="#">abstract</a> type, or a pointer to such a type. If the function has no return value, <i>Return Type</i> must be <a href="#">OpTypeVoid</a>.</p> <p><i>Parameter N Type</i> is the type &lt;id&gt; of the type of parameter <i>N</i>. It must not be <a href="#">OpTypeVoid</a></p>				
3 + variable	33	Result <id>	<id> <i>Return Type</i>	<id>, <id>, ... <i>Parameter 0 Type,</i> <i>Parameter 1 Type,</i> ...

<b>OpTypeEvent</b>		<b>Capability:</b> <b>Kernel</b>
Declare an OpenCL event type.		
2	34	Result <id>

<b>OpTypeDeviceEvent</b>		<b>Capability:</b> <b>DeviceEnqueue</b>
Declare an OpenCL device-side event type.		
2	35	Result <id>

<b>OpTypeReserveId</b>		<b>Capability:</b> <b>Pipes</b>
Declare an OpenCL reservation id type.		
2	36	Result <id>

<b>OpTypeQueue</b>		<b>Capability:</b> <b>DeviceEnqueue</b>
Declare an OpenCL queue type.		
2	37	Result <id>

<b>OpTypePipe</b>		<b>Capability:</b> <b>Pipes</b>
Declare an OpenCL pipe type.		
<i>Qualifier</i> is the pipe access qualifier.		
3	38	Result <id> Access Qualifier <i>Qualifier</i>

<b>OpTypeForwardPointer</b>			<b>Capability:</b> <b>Addresses,</b> <b>PhysicalStorageBufferAddresses</b>
Declare the Storage Class for a forward reference to a pointer.			
<i>Pointer Type</i> is a forward reference to the result of an <b>OpTypePointer</b> . The type of object the pointer points to is declared by the <b>OpTypePointer</b> instruction, not this instruction. Subsequent <b>OpTypeStruct</b> instructions can use <i>Pointer Type</i> as an operand.			
<i>Storage Class</i> is the <b>Storage Class</b> of the memory holding the object pointed to.			
3	39	<id> <i>Pointer Type</i>	Storage Class

<b>OpTypePipeStorage</b>		<b>Capability:</b> <b>PipeStorage</b>
Declare the OpenCL pipe-storage type.		Missing before version 1.1.
2	322	Result <id>

<b>OpTypeNamedBarrier</b>		<b>Capability:</b> <b>NamedBarrier</b>
Declare the named-barrier type.		Missing before version 1.1.
2	327	Result <id>

## 3.32.7 Constant-Creation Instructions

<b>OpConstantTrue</b>  Declare a <b>true</b> Boolean-type scalar constant.  <i>Result Type</i> must be the scalar Boolean type.			
3	41	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <id>

<b>OpConstantFalse</b>  Declare a <b>false</b> Boolean-type scalar constant.  <i>Result Type</i> must be the scalar Boolean type.			
3	42	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <id>

<b>OpConstant</b>  Declare a new integer-type or floating-point-type scalar constant.  <i>Result Type</i> must be a scalar integer type or floating-point type.  <i>Value</i> is the bit pattern for the constant. Types 32 bits wide or smaller take one word. Larger types take multiple words, with low-order words appearing first.				
4 + variable	43	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <id>	Literal Value

<b>OpConstantComposite</b>  Declare a new composite constant.  <i>Result Type</i> must be a composite type, whose top-level members/elements/components/columns have the same type as the types of the <i>Constituents</i> . The ordering must be the same between the top-level types in <i>Result Type</i> and the <i>Constituents</i> .  <i>Constituents</i> will become members of a structure, or elements of an array, or components of a vector, or columns of a matrix. There must be exactly one <i>Constituent</i> for each top-level member/element/component/column of the result. The <i>Constituents</i> must appear in the order needed by the definition of the <i>Result Type</i> . The <i>Constituents</i> must all be <i>&lt;id&gt;</i> s of other constant declarations or an <b>OpUndef</b> .				
3 + variable	44	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <id>	<i>&lt;id&gt;</i> , <i>&lt;id&gt;</i> , ... <i>Constituents</i>

<b>OpConstantSampler</b>  Declare a new sampler constant.  <i>Result Type</i> must be <a href="#">OpTypeSampler</a> .  <i>Sampler Addressing Mode</i> is the addressing mode; a literal from <a href="#">Sampler Addressing Mode</a> .  <i>Param</i> is a 32-bit integer and is one of: 0: Non Normalized 1: Normalized  <i>Sampler Filter Mode</i> is the filter mode; a literal from <a href="#">Sampler Filter Mode</a> .					Capability: <b>LiteralSampler</b>	
6	45	<id> <i>Result Type</i>	Result <id>	Sampler Addressing Mode	Literal <i>Param</i>	Sampler Filter Mode

<b>OpConstantNull</b>  Declare a new <i>null</i> constant value.  The <i>null</i> value is type dependent, defined as follows: - Scalar Boolean: <b>false</b> - Scalar integer: 0 - Scalar floating point: +0.0 (all bits 0) - All other scalars: Abstract - Composites: Members are set recursively to the null constant according to the null value of their constituent types.  <i>Result Type</i> must be one of the following types: - Scalar or vector <a href="#">Boolean type</a> - Scalar or vector <a href="#">integer type</a> - Scalar or vector <a href="#">floating-point type</a> - Pointer type - <a href="#">Event type</a> - <a href="#">Device side event type</a> - <a href="#">Reservation id type</a> - <a href="#">Queue type</a> - <a href="#">Composite type</a>						
3	46	<id> <i>Result Type</i>	Result <id>			

**OpSpecConstantTrue**

Declare a [Boolean-type](#) scalar specialization constant with a default value of **true**.

This instruction can be specialized to become either an [OpConstantTrue](#) or [OpConstantFalse](#) instruction.

*Result Type* must be the scalar [Boolean type](#).

See [Specialization](#).

3	48	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>
---	----	---	-----------------------------------

**OpSpecConstantFalse**

Declare a [Boolean-type](#) scalar specialization constant with a default value of **false**.

This instruction can be specialized to become either an [OpConstantTrue](#) or [OpConstantFalse](#) instruction.

*Result Type* must be the scalar [Boolean type](#).

See [Specialization](#).

3	49	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>
---	----	---	-----------------------------------

**OpSpecConstant**

Declare a new [integer-type](#) or [floating-point-type](#) scalar specialization constant.

*Result Type* must be a scalar [integer type](#) or [floating-point type](#).

*Value* is the bit pattern for the default value of the constant. Types 32 bits wide or smaller take one word. Larger types take multiple words, with low-order words appearing first.

This instruction can be specialized to become an [OpConstant](#) instruction.

See [Specialization](#).

4 + variable	50	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Literal Value</a>
--------------	----	---	-----------------------------------	-------------------------------

**OpSpecConstantComposite**

Declare a new [composite](#) specialization constant.

*Result Type* must be a [composite](#) type, whose top-level members/elements/components/columns have the same type as the types of the *Constituents*. The ordering must be the same between the top-level types in *Result Type* and the *Constituents*.

*Constituents* will become members of a structure, or elements of an array, or components of a vector, or columns of a matrix. There must be exactly one *Constituent* for each top-level member/element/component/column of the result. The *Constituents* must appear in the order needed by the definition of the type of the result. The *Constituents* must be the *<id>* of other specialization constant or constant declarations.

This instruction will be specialized to an [OpConstantComposite](#) instruction.

See [Specialization](#).

3 + variable	51	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<i>&lt;id&gt;, &lt;id&gt;, ...</i> <i>Constituents</i>
--------------	----	---	-----------------------------------	---

**OpSpecConstantOp**

Declare a new specialization constant that results from doing an operation.

*Result Type* must be the type required by the *Result Type* of *Opcode*.

*Opcode* is an unsigned 32-bit integer. It must equal one of the following opcodes.

**OpSConvert**, **OpUConvert** ([missing before version 1.4](#)), **OpFConvert**

**OpSNegate**, **OpNot**

**OpIAdd**, **OpISub**

**OpIMul**, **OpUDiv**, **OpSDiv**, **OpUMod**, **OpSRem**, **OpSMod**

**OpShiftRightLogical**, **OpShiftRightArithmetic**, **OpShiftLeftLogical**

**OpBitwiseOr**, **OpBitwiseXor**, **OpBitwiseAnd**

**OpVectorShuffle**, **OpCompositeExtract**, **OpCompositeInsert**

**OpLogicalOr**, **OpLogicalAnd**, **OpLogicalNot**,

**OpLogicalEqual**, **OpLogicalNotEqual**

**OpSelect**

**OpIEqual**, **OpINotEqual**

**OpULessThan**, **OpSLessThan**

**OpUGreaterThan**, **OpSGreaterThan**

**OpULEssThanEqual**, **OpSLessThanEqual**

**OpUGreaterThanEqual**, **OpSGreaterThanEqual**

If the **Shader** capability was declared, the following opcode is also valid:

**OpQuantizeToF16**

If the **Kernel** capability was declared, the following opcodes are also valid:

**OpConvertFToS**, **OpConvertSToF**

**OpConvertFToU**, **OpConvertUToF**

**OpUConvert**

**OpConvertPtrToU**, **OpConvertUToPtr**

**OpGenericCastToPtr**, **OpPtrCastToGeneric**

**OpBitcast**

**OpFNegate**

**OpFAdd**, **OpFSub**

**OpFMul**, **OpFDiv**

**OpFRem**, **OpFMod**

**OpAccessChain**, **OpInBoundsAccessChain**

**OpPtrAccessChain**, **OpInBoundsPtrAccessChain**

*Operands* are the operands required by *opcode*, and satisfy the semantics of *opcode*. In addition, all *Operands* must be either:

- the *<id>*s of other [constant instructions](#), or
- **OpUndef**, when allowed by *opcode*, or
- for the **AccessChain** named opcodes, their *Base* is allowed to be a global (module scope) [OpVariable](#) instruction.

See [Specialization](#).

4 + variable	52	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Literal</a> <i>Opcode</i>	<i>&lt;id&gt;</i> , <i>&lt;id&gt;</i> , ... <i>Operands</i>
--------------	----	---	-----------------------------------	--	--

## 3.32.8 Memory Instructions

**OpVariable**

Allocate an object in memory, resulting in a pointer to it, which can be used with [OpLoad](#) and [OpStore](#).

*Result Type* must be an [OpTypePointer](#). Its *Type* operand is the type of object in memory.

*Storage Class* is the [Storage Class](#) of the memory holding the object. It cannot be **Generic**. It must be the same as the *Storage Class* operand of the *Result Type*.

*Initializer* is optional. If *Initializer* is present, it will be the initial value of the variable's memory content. *Initializer* must be an *<id>* from a [constant instruction](#) or a global (module scope) [OpVariable](#) instruction. *Initializer* must have the same type as the type pointed to by *Result Type*.

4 + variable	59	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Storage Class</a>	Optional <i>&lt;id&gt;</i> <i>Initializer</i>
--------------	----	---	-----------------------------------	-------------------------------	---

**OpImageTexelPointer**

Form a pointer to a texel of an image. Use of such a pointer is limited to atomic operations.

*Result Type* must be an [OpTypePointer](#) whose [Storage Class](#) operand is **Image**. Its *Type* operand must be a scalar [numerical type](#) or [OpTypeVoid](#).

*Image* must have a type of [OpTypePointer](#) with *Type* [OpTypeImage](#). The *Sampled Type* of the type of *Image* must be the same as the *Type* pointed to by *Result Type*. The [Dim](#) operand of *Type* cannot be **SubpassData**.

*Coordinate* and *Sample* specify which texel and sample within the image to form a pointer to.

*Coordinate* must be a scalar or vector of [integer type](#). It must have the number of components specified below, given the following *Arrayed* and [Dim](#) operands of the type of the [OpTypeImage](#).

If *Arrayed* is 0:

**1D**: scalar

**2D**: 2 components

**3D**: 3 components

**Cube**: 3 components

**Rect**: 2 components

**Buffer**: scalar

If *Arrayed* is 1:

**1D**: 2 components

**2D**: 3 components

**Cube**: 3 components; the face and layer combine into the 3rd component, *layer\_face*, such that face is *layer\_face* % 6 and layer is floor(*layer\_face* / 6)

*Sample* must be an [integer type](#) scalar. It specifies which sample to select at the given coordinate. It must be a valid *<id>* for the value 0 if the [OpTypeImage](#) has *MS* of 0.

6	60	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<i>&lt;id&gt;</i> <i>Image</i>	<i>&lt;id&gt;</i> <i>Coordinate</i>	<i>&lt;id&gt;</i> <i>Sample</i>
---	----	---	-----------------------------------	-----------------------------------	--	------------------------------------

**OpLoad**

Load through a pointer.

*Result Type* is the type of the loaded object. It must be a type with fixed size; i.e., it cannot be, nor include, any [OpTypeRuntimeArray](#) types.

*Pointer* is the pointer to load through. Its type must be an [OpTypePointer](#) whose *Type* operand is the same as *Result Type*.

If present, any *Memory Operands* must begin with a [memory operand](#) literal. If not present, it is the same as specifying the [memory operand](#) **None**.

4 + variable	61	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	Optional <a href="#">Memory Operands</a>
--------------	----	----------------------------	-----------------------------------	------------------------	---

**OpStore**

Store through a pointer.

*Pointer* is the pointer to store through. Its type must be an [OpTypePointer](#) whose *Type* operand is the same as the type of *Object*.

*Object* is the object to store.

If present, any *Memory Operands* must begin with a [memory operand](#) literal. If not present, it is the same as specifying the [memory operand](#) **None**.

3 + variable	62	<id> <i>Pointer</i>	<id> <i>Object</i>	Optional <a href="#">Memory Operands</a>
--------------	----	------------------------	-----------------------	---

**OpCopyMemory**

Copy from the memory pointed to by *Source* to the memory pointed to by *Target*. Both operands must be non-void pointers and having the same <id> *Type* operand in their **OpTypePointer** type declaration. Matching Storage Class is not required. The amount of memory copied is the size of the type pointed to. The copied type must have a fixed size; i.e., it cannot be, nor include, any [OpTypeRuntimeArray](#) types.

If present, any *Memory Operands* must begin with a [memory operand](#) literal. If not present, it is the same as specifying the [memory operand](#) **None**. Before **version 1.4**, at most one [memory operands](#) mask can be provided. Starting with **version 1.4** two masks can be provided, as described in [Memory Operands](#). If no masks or only one mask is present, it applies to both *Source* and *Target*. If two masks are present, the first applies to *Target* and cannot include **MakePointerVisible**, and the second applies to *Source* and cannot include **MakePointerAvailable**.

3 + variable	63	<id> <i>Target</i>	<id> <i>Source</i>	Optional <a href="#">Memory Operands</a>	Optional <a href="#">Memory Operands</a>
--------------	----	-----------------------	-----------------------	---	---

<b>OpCopyMemorySized</b>  Copy from the memory pointed to by <i>Source</i> to the memory pointed to by <i>Target</i> .  <i>Size</i> is the number of bytes to copy. It must have a scalar <a href="#">integer type</a> . If it is a <a href="#">constant instruction</a> , the constant value cannot be 0. It is invalid for both the constant's type to have <i>Signedness</i> of 1 and to have the sign bit set. Otherwise, as a run-time value, <i>Size</i> is treated as unsigned, and if its value is 0, no memory access will be made.  If present, any <i>Memory Operands</i> must begin with a <a href="#">memory operand</a> literal. If not present, it is the same as specifying the <a href="#">memory operand None</a> . Before <b>version 1.4</b> , at most one <a href="#">memory operands</a> mask can be provided. Starting with <b>version 1.4</b> two masks can be provided, as described in <a href="#">Memory Operands</a> . If no masks or only one mask is present, it applies to both <i>Source</i> and <i>Target</i> . If two masks are present, the first applies to <i>Target</i> and cannot include <b>MakePointerVisible</b> , and the second applies to <i>Source</i> and cannot include <b>MakePointerAvailable</b> .					<a href="#">Capability:</a> <b>Addresses</b>	
4 + variable	64	<id> <i>Target</i>	<id> <i>Source</i>	<id> <i>Size</i>	Optional <a href="#">Memory Operands</a>	Optional <a href="#">Memory Operands</a>

<b>OpAccessChain</b>  Create a pointer into a <a href="#">composite</a> object that can be used with <a href="#">OpLoad</a> and <a href="#">OpStore</a> .  <i>Result Type</i> must be an <a href="#">OpTypePointer</a> . Its <i>Type</i> operand must be the type reached by walking the <i>Base</i> 's type hierarchy down to the last provided index in <i>Indexes</i> , and its <i>Storage Class</i> operand must be the same as the Storage Class of <i>Base</i> .  <i>Base</i> must be a pointer, pointing to the base of a composite object.  <i>Indexes</i> walk the type hierarchy to the desired depth, potentially down to scalar granularity. The first index in <i>Indexes</i> will select the top-level member/element/component/element of the base composite. All composite constituents use zero-based numbering, as described by their <b>OpType...</b> instruction. The second index will apply similarly to that result, and so on. Once any non-composite type is reached, there must be no remaining (unused) indexes.  Each index in <i>Indexes</i> <ul style="list-style-type: none"> <li>- must be a scalar <a href="#">integer type</a>,</li> <li>- is treated as a signed count, and</li> <li>- must be an <a href="#">OpConstant</a> when indexing into a structure, and</li> <li>- must be in-bounds when indexing into an array, if the result type is a <a href="#">logical pointer type</a>.</li> </ul>					
4 + variable	65	<id> <i>Result Type</i>	<a href="#">Result</a> <id>	<id> <i>Base</i>	<id>, <id>, ... <i>Indexes</i>

<b>OpInBoundsAccessChain</b>					
Has the same semantics as <a href="#">OpAccessChain</a> , with the addition that the resulting pointer is known to point within the base object.					
4 + variable	66	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<i>&lt;id&gt;</i> <i>Base</i>	<i>&lt;id&gt;, &lt;id&gt;, ...</i> <i>Indexes</i>

<b>OpPtrAccessChain</b>  Has the same semantics as <b>OpAccessChain</b> , with the addition of the <i>Element</i> operand.  <i>Element</i> is used to do an initial dereference of <i>Base</i> : <i>Base</i> is treated as the address of an element in an array, and a new element address is computed from <i>Base</i> and <i>Element</i> to become the <b>OpAccessChain</b> <i>Base</i> to dereference as per <b>OpAccessChain</b> . This computed <i>Base</i> has the same type as the originating <i>Base</i> .  To compute the new element address, <i>Element</i> is treated as a signed count of elements <i>E</i> , relative to the original <i>Base</i> element <i>B</i> , and the address of element <i>B</i> + <i>E</i> is computed using enough precision to avoid overflow and underflow. For objects in the <b>Uniform</b> , <b>StorageBuffer</b> , or <b>PushConstant</b> storage classes, the element’s address or location is calculated using a stride, which will be the <i>Base</i> -type’s <i>Array Stride</i> when the <i>Base</i> type is decorated with <b>ArrayStride</b> . For all other objects, the implementation will calculate the element’s address or location.  With one exception, undefined behavior results when <i>B</i> + <i>E</i> is not an element in the same array (same innermost array, if array types are nested) as <i>B</i> . The exception being that the result is still well defined when <i>B</i> + <i>E</i> = <i>L</i> , where <i>L</i> is the length of the array: the address computation for element <i>L</i> is done with the same stride as any other <i>B</i> + <i>E</i> computation that stays within the array.  Note: If <i>Base</i> is typed to be a pointer to an array and the desired operation is to select an element of that array, <b>OpAccessChain</b> should be directly used, as its first <i>Index</i> will select the array element.					<b>Capability:</b> <b>Addresses, VariablePointers, VariablePointersStorageBuffer, PhysicalStorageBufferAddresses</b>	
5 + variable	67	<id> Result Type	Result <id>	<id> Base	<id> Element	<id>, <id>, ... Indexes

<b>OpArrayLength</b>  Length of a run-time array.  <i>Result Type</i> must be an <b>OpTypeInt</b> with 32-bit <i>Width</i> and 0 <i>Signedness</i> .  <i>Structure</i> must be a <b>logical pointer</b> to an <b>OpTypeStruct</b> whose last member is a run-time array.  <i>Array member</i> is an unsigned 32-bit integer index of the last member of the structure that <i>Structure</i> points to. That member's type must be from <b>OpTypeRuntimeArray</b> .				<b>Capability:</b> <b>Shader</b>	
5	68	<id> <i>Result Type</i>	Result <id>	<id> <i>Structure</i>	Literal <i>Array member</i>

<b>OpGenericPtrMemSemantics</b>  Result is a valid <b>Memory Semantics</b> which includes mask bits set for the Storage Class for the specific (non-Generic) Storage Class of <i>Pointer</i> .  <i>Pointer</i> must point to <b>Generic Storage Class</b> .  <i>Result Type</i> must be an <b>OpTypeInt</b> with 32-bit <i>Width</i> and 0 <i>Signedness</i> .				<b>Capability:</b> <b>Kernel</b>	
4	69	<id> <i>Result Type</i>	Result <id>	<id> <i>Pointer</i>	

<b>OpInBoundsPtrAccessChain</b>  Has the same semantics as <b>OpPtrAccessChain</b> , with the addition that the resulting pointer is known to point within the base object.				<b>Capability:</b> <b>Addresses</b>	
5 + variable	70	<id> <i>Result Type</i>	Result <id>	<id> <i>Base</i>	<id>, <id>, ... <i>Indexes</i>

<b>OpPtrEqual</b>  Result is <b>true</b> if <i>Operand 1</i> and <i>Operand 2</i> have the same value. Result is <b>false</b> if <i>Operand 1</i> and <i>Operand 2</i> have different values.  <i>Result Type</i> must be a <b>Boolean type</b> scalar.  The types of <i>Operand 1</i> and <i>Operand 2</i> must be <b>OpTypePointer</b> of the same type.				<b>Missing before version 1.4.</b>	
5	401	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>

<b>OpPtrNotEqual</b>  Result is <b>true</b> if <i>Operand 1</i> and <i>Operand 2</i> have different values. Result is <b>false</b> if <i>Operand 1</i> and <i>Operand 2</i> have the same value.  <i>Result Type</i> must be a <b>Boolean type</b> scalar.  The types of <i>Operand 1</i> and <i>Operand 2</i> must be <b>OpTypePointer</b> of the same type.				Missing before version 1.4.	
5	402	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>

<b>OpPtrDiff</b>  Element-number subtraction: The number of elements to add to <i>Operand 2</i> to get to <i>Operand 1</i> .  <i>Result Type</i> must be an <b>integer type</b> scalar. It will be computed as a signed value, as negative differences are allowed, independently of the signed bit in the type. The result will equal the low-order <i>N</i> bits of the correct result <i>R</i> , where <i>R</i> is computed with enough precision to avoid overflow and underflow and <i>Result Type</i> has a bitwidth of <i>N</i> bits.  The units of <i>Result Type</i> are a count of elements. I.e., the same value you would use as the <i>Element</i> operand to <b>OpPtrAccessChain</b> .  The types of <i>Operand 1</i> and <i>Operand 2</i> must be <b>OpTypePointer</b> of exactly the same type, and point to a type that can be aggregated into an array. For an array of length <i>L</i> , <i>Operand 1</i> and <i>Operand 2</i> can point to any element in the <b>range</b> <i>[0, L]</i> , where element <i>L</i> is outside the array but has a representative address computed with the same stride as elements in the array. Additionally, <i>Operand 1</i> must be a valid <i>Base</i> operand of <b>OpPtrAccessChain</b> . Behavior is undefined if <i>Operand 1</i> and <i>Operand 2</i> are not pointers to element numbers in <i>[0, L]</i> in the same array.				<b>Capability:</b> <b>Addresses, VariablePointers, VariablePointersStorageBuffer</b>  Missing before version 1.4.	
5	403	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>

### 3.32.9 Function Instructions

#### OpFunction

Add a function. This instruction must be immediately followed by one [OpFunctionParameter](#) instruction per each formal parameter of this function. This function's body or declaration will terminate with the next [OpFunctionEnd](#) instruction.

*Result Type* must be the same as the *Return Type* declared in *Function Type*.

*Function Type* is the result of an [OpTypeFunction](#), which declares the types of the return value and parameters of the function.

5	54	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Function Control</a>	<id> <i>Function Type</i>
---	----	----------------------------	-----------------------------------	----------------------------------	------------------------------

#### OpFunctionParameter

Declare a formal parameter of the current function.

*Result Type* is the type of the parameter.

This instruction must immediately follow an [OpFunction](#) or [OpFunctionParameter](#) instruction. The order of contiguous **OpFunctionParameter** instructions is the same order arguments will be listed in an [OpFunctionCall](#) instruction to this function. It is also the same order in which *Parameter Type* operands are listed in the [OpTypeFunction](#) of the *Function Type* operand for this function's [OpFunction](#) instruction.

3	55	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>
---	----	----------------------------	-----------------------------------

#### OpFunctionEnd

Last instruction of a function.

1	56
---	----

**OpFunctionCall**

Call a function.

*Result Type* is the type of the return value of the function. It must be the same as the *Return Type* operand of the *Function Type* operand of the *Function* operand.

*Function* is an [OpFunction](#) instruction. This could be a forward reference.

*Argument N* is the object to copy to parameter *N* of *Function*.

**Note:** A forward call is possible because there is no missing type information: *Result Type* must match the *Return Type* of the function, and the calling argument types must match the formal parameter types.

4 + variable	57	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Function</i>	<id>, <id>, ... <i>Argument 0</i> , <i>Argument 1</i> , ...
--------------	----	----------------------------	-----------------------------------	-------------------------	--

## 3.32.10 Image Instructions

**OpSampledImage**

Create a **sampled image**, containing both a **sampler** and an **image**.

*Result Type* must be the **OpTypeSampledImage** type whose *Image Type* operand is the type of *Image*.

*Image* is an object whose type is an **OpTypeImage**, whose *Sampled* operand is 0 or 1, and whose **Dim** operand is not **SubpassData**.

*Sampler* must be an object whose type is **OpTypeSampler**.

5	86	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<id> <i>Image</i>	<id> <i>Sampler</i>
---	----	----------------------------	--------------------------	----------------------	------------------------

**OpImageSampleImplicitLod**

Sample an image with an implicit level of detail.

*Result Type* must be a vector of four components of **floating-point type** or **integer type**. Its components must be the same as *Sampled Type* of the underlying **OpTypeImage** (unless that underlying *Sampled Type* is **OpTypeVoid**).

*Sampled Image* must be an object whose type is **OpTypeSampledImage**.

*Coordinate* must be a scalar or vector of **floating-point type**. It contains (*u*[, *v*] ... [, *array layer*]) as needed by the definition of *Sampled Image*. It may be a vector larger than needed, but all unused components will appear after all used components.

*Image Operands* encodes what operands follow, as per **Image Operands**.

This instruction is only valid in the **Fragment Execution Model**. In addition, it consumes an implicit derivative that can be affected by code motion.

**Capability:**  
**Shader**

5 + variable	87	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<id> <i>Sampled Image</i>	<id> <i>Coordinate</i>	Optional <b>Image Operands</b>	Optional <id>, <id>, ...
--------------	----	----------------------------	--------------------------	------------------------------	---------------------------	-----------------------------------	-----------------------------

**OpImageSampleExplicitLod**

Sample an image using an explicit level of detail.

*Result Type* must be a vector of four components of [floating-point type](#) or [integer type](#). Its components must be the same as *Sampled Type* of the underlying [OpTypeImage](#) (unless that underlying *Sampled Type* is **OpTypeVoid**).

*Sampled Image* must be an object whose type is [OpTypeSampledImage](#).

*Coordinate* must be a scalar or vector of [floating-point type](#) or [integer type](#). It contains ( $u$ ,  $v$ ) ... [ $array\ layer$ ] as needed by the definition of *Sampled Image*. Unless the **Kernel capability** is being used, it must be floating point. It may be a vector larger than needed, but all unused components will appear after all used components.

*Image Operands* encodes what operands follow, as per [Image Operands](#). Either **Lod** or **Grad** image operands must be present.

7 + variable	88	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Sampled Image</i>	<id> <i>Coordinate</i>	<a href="#">Image Operands</a>	<id>	Optional <id>, <id>, ...
-----------------	----	--------------------------------	---------------------------------------	----------------------------------	---------------------------	------------------------------------	------	--------------------------------

**OpImageSampleDrefImplicitLod**

Sample an image doing depth-comparison with an implicit level of detail.

*Result Type* must be a scalar of [integer type](#) or [floating-point type](#). It must be the same as *Sampled Type* of the underlying [OpTypeImage](#).

*Sampled Image* must be an object whose type is [OpTypeSampledImage](#).

*Coordinate* must be a scalar or vector of [floating-point type](#). It contains ( $u$ ,  $v$ ) ... [ $array\ layer$ ] as needed by the definition of *Sampled Image*. It may be a vector larger than needed, but all unused components will appear after all used components.

$D_{ref}$  is the depth-comparison reference value.

*Image Operands* encodes what operands follow, as per [Image Operands](#).

This instruction is only valid in the **Fragment Execution Model**. In addition, it consumes an implicit derivative that can be affected by code motion.

[Capability:](#)  
**Shader**

6 + variable	89	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Sampled Image</i>	<id> <i>Coordinate</i>	<id> $D_{ref}$	Optional <a href="#">Image Operands</a>	Optional <id>, <id>, ...
-----------------	----	--------------------------------	---------------------------------------	----------------------------------	---------------------------	-------------------	--	--------------------------------

<b>OpImageSampleDrefExplicitLod</b>  Sample an image doing depth-comparison using an explicit level of detail.  <i>Result Type</i> must be a scalar of <a href="#">integer type</a> or <a href="#">floating-point type</a> . It must be the same as <i>Sampled Type</i> of the underlying <a href="#">OpTypeImage</a> .  <i>Sampled Image</i> must be an object whose type is <a href="#">OpTypeSampledImage</a> .  <i>Coordinate</i> must be a scalar or vector of <a href="#">floating-point type</a> . It contains ( $u$ , $v$ ] ... [, <i>array layer</i> ]) as needed by the definition of <i>Sampled Image</i> . It may be a vector larger than needed, but all unused components will appear after all used components.  <i>D<sub>ref</sub></i> is the depth-comparison reference value.  <i>Image Operands</i> encodes what operands follow, as per <a href="#">Image Operands</a> . Either <b>Lod</b> or <b>Grad</b> image operands must be present.							<a href="#">Capability:</a> <b>Shader</b>

<b>OpImageSampleProjDrefImplicitLod</b>  Sample an image with a project coordinate, doing depth-comparison, with an implicit level of detail.  <i>Result Type</i> must be a scalar of <a href="#">integer type</a> or <a href="#">floating-point type</a> . It must be the same as <i>Sampled Type</i> of the underlying <a href="#">OpTypeImage</a> .  <i>Sampled Image</i> must be an object whose type is <a href="#">OpTypeSampledImage</a> . The <a href="#">Dim</a> operand of the underlying <a href="#">OpTypeImage</a> must be <b>1D</b> , <b>2D</b> , <b>3D</b> , or <b>Rect</b> , and the <i>Arrayed</i> and <i>MS</i> operands must be 0.  <i>Coordinate</i> is a floating-point vector containing $(u [ , v ] [ , w ] , q)$ , as needed by the definition of <i>Sampled Image</i> , with the $q$ component consumed for the projective division. That is, the actual sample coordinate will be $(u/q [ , v/q ] [ , w/q ])$ , as needed by the definition of <i>Sampled Image</i> . It may be a vector larger than needed, but all unused components will appear after all used components.  $D_{ref} / q$ is the depth-comparison reference value.  <i>Image Operands</i> encodes what operands follow, as per <a href="#">Image Operands</a> .  This instruction is only valid in the <b>Fragment Execution Model</b> . In addition, it consumes an implicit derivative that can be affected by code motion.						<a href="#">Capability:</a> <b>Shader</b>		
6 + variable	93	<id> <i>Result Type</i>	<a href="#">Result</a> <a href="#">&lt;id&gt;</a>	<id> <i>Sampled Image</i>	<id> <i>Coordinate</i>	<id> $D_{ref}$	Optional <a href="#">Image Operands</a>	Optional <id>, ... <id>, ...

<b>OpImageSampleProjDrefExplicitLod</b>  Sample an image with a project coordinate, doing depth-comparison, using an explicit level of detail.  <i>Result Type</i> must be a scalar of <a href="#">integer type</a> or <a href="#">floating-point type</a> . It must be the same as <i>Sampled Type</i> of the underlying <a href="#">OpTypeImage</a> .  <i>Sampled Image</i> must be an object whose type is <a href="#">OpTypeSampledImage</a> . The <a href="#">Dim</a> operand of the underlying <a href="#">OpTypeImage</a> must be <b>1D</b> , <b>2D</b> , <b>3D</b> , or <b>Rect</b> , and the <i>Arrayed</i> and <i>MS</i> operands must be 0.  <i>Coordinate</i> is a floating-point vector containing ( $u$ [, $v$ ] [, $w$ ], $q$ ), as needed by the definition of <i>Sampled Image</i> , with the $q$ component consumed for the projective division. That is, the actual sample coordinate will be ( $u/q$ [, $v/q$ ] [, $w/q$ ]), as needed by the definition of <i>Sampled Image</i> . It may be a vector larger than needed, but all unused components will appear after all used components.  $D_{ref}/q$ is the depth-comparison reference value.  <i>Image Operands</i> encodes what operands follow, as per <a href="#">Image Operands</a> . Either <b>Lod</b> or <b>Grad</b> image operands must be present.							<a href="#">Capability:</a> <b>Shader</b>

It contains ( $u$ , $v$ ) ... [ $array\ layer$ ] as needed by the definition of <i>Sampled Image</i> .  <i>D<sub>ref</sub></i> is the depth-comparison reference value.  <i>Image Operands</i> encodes what operands follow, as per <a href="#">Image Operands</a> .						<a href="#">Capability:</a> <b>Shader</b>		
6 + variable	97	<id> <i>Result Type</i>	<a href="#">Result</a> <a href="#">&lt;id&gt;</a>	<id> <i>Sampled Image</i>	<id> <i>Coordinate</i>	<id> <i>D<sub>ref</sub></i>	Optional <a href="#">Image Operands</a>	Optional <id>, ... <id>, ...

**OpImageRead**

Read a texel from an [image](#) without a [sampler](#).

*Result Type* must be a scalar or vector of [floating-point type](#) or [integer type](#). Its component type must be the same as *Sampled Type* of the [OpTypeImage](#) (unless that *Sampled Type* is **OpTypeVoid**).

*Image* must be an object whose type is [OpTypeImage](#) with a *Sampled* operand of 0 or 2. If the *Sampled* operand is 2, then some [dimensions](#) require a [capability](#); e.g., **Image1D**, **ImageRect**, or **ImageBuffer**. If the *Arrayed* operand is 1, then additional capabilities may be required; e.g., **ImageCubeArray**, or **ImageMSArray**.

*Coordinate* is an integer scalar or vector containing non-normalized texel coordinates ( $u[, v] \dots [, \text{array layer}]$ ) as needed by the definition of *Image*. If the coordinates are outside the image, the memory location that is accessed is undefined.

When the *Image Dim* operand is **SubpassData**, *Coordinate* is relative to the current fragment location. That is, the integer value (rounded down) of the current fragment's window-relative ( $x, y$ ) coordinate is added to  $(u, v)$ .

When the *Image Dim* operand is not **SubpassData**, the [Image Format](#) must not be **Unknown**, unless the **StorageImageReadWithoutFormat Capability** was declared.

*Image Operands* encodes what operands follow, as per [Image Operands](#).

5 + variable	98	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Image</i>	<id> <i>Coordinate</i>	Optional <a href="#">Image Operands</a>	Optional <id>, <id>, ...
--------------	----	----------------------------	-----------------------------------	----------------------	---------------------------	--	-----------------------------

**OpImageWrite**

Write a texel to an [image](#) without a [sampler](#).

*Image* must be an object whose type is [OpTypeImage](#) with a *Sampled* operand of 0 or 2. If the *Sampled* operand is 2, then some [dimensions](#) require a [capability](#); e.g., **Image1D**, **ImageRect**, or **ImageBuffer**. If the *Arrayed* operand is 1, then additional capabilities may be required; e.g., **ImageCubeArray**, or **ImageMSArray**. Its *Dim* operand cannot be **SubpassData**.

*Coordinate* is an integer scalar or vector containing non-normalized texel coordinates ( $u[, v] \dots [, \text{array layer}]$ ) as needed by the definition of *Image*. If the coordinates are outside the image, the memory location that is accessed is undefined.

*Texel* is the data to write. Its component type must be the same as *Sampled Type* of the [OpTypeImage](#) (unless that *Sampled Type* is **OpTypeVoid**).

The [Image Format](#) must not be **Unknown**, unless the **StorageImageWriteWithoutFormat Capability** was declared.

*Image Operands* encodes what operands follow, as per [Image Operands](#).

4 + variable	99	<id> <i>Image</i>	<id> <i>Coordinate</i>	<id> <i>Texel</i>	Optional <a href="#">Image Operands</a>	Optional <id>, <id>, ...
--------------	----	----------------------	---------------------------	----------------------	--	-----------------------------

<b>OpImage</b>  Extract the image from a sampled image.  <i>Result Type</i> must be <a href="#">OpTypeImage</a> .  <i>Sampled Image</i> must have type <a href="#">OpTypeSampledImage</a> whose <i>Image Type</i> is the same as <i>Result Type</i> .				
4	100	<id> <i>Result Type</i>	Result <id>	<id> <i>Sampled Image</i>

<b>OpImageQueryFormat</b>  Query the image format of an image created with an <b>Unknown Image Format</b> .  <i>Result Type</i> must be a scalar <a href="#">integer type</a> . The resulting value is an enumerant from <a href="#">Image Channel Data Type</a> .  <i>Image</i> must be an object whose type is <a href="#">OpTypeImage</a> .			<b>Capability:</b> <b>Kernel</b>	
4	101	<id> <i>Result Type</i>	Result <id>	<id> <i>Image</i>

<b>OpImageQueryOrder</b>  Query the channel order of an image created with an <b>Unknown Image Format</b> .  <i>Result Type</i> must be a scalar <a href="#">integer type</a> . The resulting value is an enumerant from <a href="#">Image Channel Order</a> .  <i>Image</i> must be an object whose type is <a href="#">OpTypeImage</a> .			<b>Capability:</b> <b>Kernel</b>	
4	102	<id> <i>Result Type</i>	Result <id>	<id> <i>Image</i>

<b>OpImageQuerySizeLod</b>  Query the dimensions of <i>Image</i> for mipmap level for <i>Level of Detail</i> .  <i>Result Type</i> must be an <b>integer type</b> scalar or vector. The number of components must be 1 for the <b>1D dimensionality</b> , 2 for the <b>2D</b> and <b>Cube dimensionalities</b> , 3 for the <b>3D dimensionality</b> , plus 1 more if the image type is arrayed. This vector is filled in with ( <i>width</i> [, <i>height</i> ] [, <i>depth</i> ] [, <i>elements</i> ]) where <i>elements</i> is the number of layers in an image array, or the number of cubes in a cube-map array.  <i>Image</i> must be an object whose type is <b>OpTypeImage</b> . Its <b>Dim</b> operand must be one of <b>1D</b> , <b>2D</b> , <b>3D</b> , or <b>Cube</b> , and its <i>MS</i> must be 0. See <b>OpImageQuerySize</b> for querying image types without level of detail. This operation is allowed on an image decorated as <b>NonReadable</b> . See the client API specification for additional image type restrictions.  <i>Level of Detail</i> is used to compute which mipmap level to query, as specified by the client API.				<b>Capability:</b> <b>Kernel, ImageQuery</b>	
5	103	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<id> <i>Image</i>	<id> <i>Level of Detail</i>

<b>OpImageQuerySize</b>  Query the dimensions of <i>Image</i> , with no level of detail.  <i>Result Type</i> must be an <b>integer type</b> scalar or vector. The number of components must be: 1 for the <b>1D</b> and <b>Buffer dimensionalities</b> , 2 for the <b>2D</b> , <b>Cube</b> , and <b>Rect dimensionalities</b> , 3 for the <b>3D dimensionality</b> , plus 1 more if the image type is arrayed. This vector is filled in with ( <i>width</i> [, <i>height</i> ] [, <i>elements</i> ]) where <i>elements</i> is the number of layers in an image array or the number of cubes in a cube-map array.  <i>Image</i> must be an object whose type is <b>OpTypeImage</b> . Its <b>Dim</b> operand must be one of those listed under <i>Result Type</i> , above. Additionally, if its <i>Dim</i> is <b>1D</b> , <b>2D</b> , <b>3D</b> , or <b>Cube</b> , it must also have either an <i>MS</i> of 1 or a <i>Sampled</i> of 0 or 2. There is no implicit level-of-detail consumed by this instruction. See <b>OpImageQuerySizeLod</b> for querying images having level of detail. This operation is allowed on an image decorated as <b>NonReadable</b> . See the client API specification for additional image type restrictions.				<b>Capability:</b> <b>Kernel, ImageQuery</b>	
---	--	--	--	---	--

4	104	<i>&lt;id&gt; Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt; Image</i>
---	-----	-----------------------------------	--------------------------	-----------------------------

<b>OpImageQueryLod</b>  Query the mipmap level and the level of detail for a hypothetical sampling of <i>Image</i> at <i>Coordinate</i> using an implicit level of detail.  <i>Result Type</i> must be a two-component <a href="#">floating-point type</a> vector. The first component of the result will contain the mipmap array layer. The second component of the result will contain the implicit level of detail relative to the base level.  <i>Sampled Image</i> must be an object whose type is <a href="#">OpTypeSampledImage</a> . Its <a href="#">Dim</a> operand must be one of <b>1D</b> , <b>2D</b> , <b>3D</b> , or <b>Cube</b> .  <i>Coordinate</i> must be a scalar or vector of <a href="#">floating-point type</a> or <a href="#">integer type</a> . It contains ( <i>u</i> [, <i>v</i> ] . . . ) as needed by the definition of <i>Sampled Image</i> , not including any array layer index. Unless the <b>Kernel capability</b> is being used, it must be floating point.  If called on an incomplete image, the results are undefined.  This instruction is only valid in the <b>Fragment Execution Model</b> . In addition, it consumes an implicit derivative that can be affected by code motion.			<a href="#">Capability:</a> <b>ImageQuery</b>		
5	105	<a href="#">&lt;id&gt;</a> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">&lt;id&gt;</a> <i>Sampled Image</i>	<a href="#">&lt;id&gt;</a> <i>Coordinate</i>

<b>OpImageQueryLevels</b>  Query the number of mipmap levels accessible through <i>Image</i> .  <i>Result Type</i> must be a scalar <a href="#">integer type</a> . The result is the number of mipmap levels, as specified by the client API.  <i>Image</i> must be an object whose type is <a href="#">OpTypeImage</a> . Its <a href="#">Dim</a> operand must be one of <b>1D</b> , <b>2D</b> , <b>3D</b> , or <b>Cube</b> . See the client API specification for additional image type restrictions.			<a href="#">Capability:</a> <b>Kernel, ImageQuery</b>		
4	106	<a href="#">&lt;id&gt;</a> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">&lt;id&gt;</a> <i>Image</i>	

<b>OpImageQuerySamples</b>  Query the number of samples available per texel fetch in a multisample image.  <i>Result Type</i> must be a scalar <b>integer type</b> . The result is the number of samples.  <i>Image</i> must be an object whose type is <b>OpTypeImage</b> . Its <b>Dim</b> operand must be one of <b>2D</b> and <i>MS</i> of 1.			<b>Capability:</b> <b>Kernel, ImageQuery</b>	
4	107	<id> <i>Result Type</i>	Result <id>	<id> <i>Image</i>

<b>OpImageSparseSampleImplicitLod</b>  Sample a sparse image with an implicit level of detail.  <i>Result Type</i> must be an <a href="#">OpTypeStruct</a> with two members. The first member's type must be an <a href="#">integer type</a> scalar. It will hold a <i>Residency Code</i> that can be passed to <a href="#">OpImageSparseTexelsResident</a> . The second member must be a vector of four components of <a href="#">floating-point type</a> or <a href="#">integer type</a> . Its components must be the same as <i>Sampled Type</i> of the underlying <a href="#">OpTypeImage</a> (unless that underlying <i>Sampled Type</i> is <a href="#">OpTypeVoid</a> ).  <i>Sampled Image</i> must be an object whose type is <a href="#">OpTypeSampledImage</a> .  <i>Coordinate</i> must be a scalar or vector of <a href="#">floating-point type</a> . It contains ( $u$ , $v$ ) ... [ $array\ layer$ ] as needed by the definition of <i>Sampled Image</i> . It may be a vector larger than needed, but all unused components will appear after all used components.  <i>Image Operands</i> encodes what operands follow, as per <a href="#">Image Operands</a> .  This instruction is only valid in the <b>Fragment Execution Model</b> . In addition, it consumes an implicit derivative that can be affected by code motion.					<a href="#">Capability:</a> <b>SparseResidency</b>

It contains ( $u$ , $v$ ) ... [ $array\ layer$ ] as needed by the definition of <i>Sampled Image</i> .  $D_{ref}$ is the depth-comparison reference value.  <i>Image Operands</i> encodes what operands follow, as per <a href="#">Image Operands</a> .						<a href="#">Capability:</a> <b>SparseResidency</b>		
6 + variable	315	<id> <i>Result Type</i>	<a href="#">Result</a> <a href="#">&lt;id&gt;</a>	<id> <i>Sampled Image</i>	<id> <i>Coordinate</i>	<id> $D_{ref}$	Optional <a href="#">Image Operands</a>	Optional <id>, ... <id>, ...

<b>OpImageSparseTexelsResident</b>  Translates a <i>Resident Code</i> into a Boolean. Result is <b>false</b> if any of the texels were in uncommitted texture memory, and <b>true</b> otherwise.  <i>Result Type</i> must be a <a href="#">Boolean type</a> scalar.  <i>Resident Code</i> is a value from an <b>OpImageSparse...</b> instruction that returns a resident code.				<a href="#">Capability:</a> <b>SparseResidency</b>			
4	316	<id> <i>Result Type</i>	<a href="#">Result</a> <a href="#">&lt;id&gt;</a>	<id> <i>Resident Code</i>			

<b>OpImageSparseRead</b>  Read a texel from a sparse <b>image</b> without a <b>sampler</b> .  <i>Result Type</i> must be an <b>OpTypeStruct</b> with two members. The first member's type must be an <b>integer type</b> scalar. It will hold a <i>Residency Code</i> that can be passed to <b>OpImageSparseTexelsResident</b> . The second member must be a scalar or vector of <b>floating-point type</b> or <b>integer type</b> . Its component type must be the same as <i>Sampled Type</i> of the <b>OpTypeImage</b> (unless that <i>Sampled Type</i> is <b>OpTypeVoid</b> ).  <i>Image</i> must be an object whose type is <b>OpTypeImage</b> with a <i>Sampled</i> operand of 2.  <i>Coordinate</i> is an integer scalar or vector containing non-normalized texel coordinates ( $u$ , $v$ ) ... [ $array\ layer$ ] as needed by the definition of <i>Image</i> . If the coordinates are outside the image, the memory location that is accessed is undefined.  The <i>Image Dim</i> operand must not be <b>SubpassData</b> . The <i>Image Format</i> must not be <b>Unknown</b> unless the <b>StorageImageReadWithoutFormat</b> <b>Capability</b> was declared.  <i>Image Operands</i> encodes what operands follow, as per <b>Image Operands</b> .					<b>Capability:</b> <b>SparseResidency</b>

## 3.32.11 Conversion Instructions

**OpConvertFToU**

Convert value numerically from floating point to unsigned integer, with round toward 0.0.

*Result Type* must be a scalar or vector of [integer type](#), whose *Signedness* operand is 0.

*Float Value* must be a scalar or vector of [floating-point type](#). It must have the same number of components as *Result Type*.

Results are computed per component.

4	109	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<i>&lt;id&gt;</i> <i>Float Value</i>
---	-----	---	-----------------------------------	---

**OpConvertFToS**

Convert value numerically from floating point to signed integer, with round toward 0.0.

*Result Type* must be a scalar or vector of [integer type](#).

*Float Value* must be a scalar or vector of [floating-point type](#). It must have the same number of components as *Result Type*.

Results are computed per component.

4	110	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<i>&lt;id&gt;</i> <i>Float Value</i>
---	-----	---	-----------------------------------	---

**OpConvertSToF**

Convert value numerically from signed integer to floating point.

*Result Type* must be a scalar or vector of [floating-point type](#).

*Signed Value* must be a scalar or vector of [integer type](#). It must have the same number of components as *Result Type*.

Results are computed per component.

4	111	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<i>&lt;id&gt;</i> <i>Signed Value</i>
---	-----	---	-----------------------------------	--

**OpConvertUToF**

Convert value numerically from unsigned integer to floating point.

*Result Type* must be a scalar or vector of [floating-point type](#).

*Unsigned Value* must be a scalar or vector of [integer type](#). It must have the same number of components as *Result Type*.

Results are computed per component.

4	112	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Unsigned Value</i>
---	-----	---	--------------------------	--

**OpUConvert**

Convert unsigned width. This is either a truncate or a zero extend.

*Result Type* must be a scalar or vector of [integer type](#), whose *Signedness* operand is 0.

*Unsigned Value* must be a scalar or vector of [integer type](#). It must have the same number of components as *Result Type*. The component width cannot equal the component width in *Result Type*.

Results are computed per component.

4	113	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Unsigned Value</i>
---	-----	---	--------------------------	--

**OpSConvert**

Convert signed width. This is either a truncate or a sign extend.

*Result Type* must be a scalar or vector of [integer type](#).

*Signed Value* must be a scalar or vector of [integer type](#). It must have the same number of components as *Result Type*. The component width cannot equal the component width in *Result Type*.

Results are computed per component.

4	114	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Signed Value</i>
---	-----	---	--------------------------	--

**OpFConvert**

Convert value numerically from one floating-point width to another width.

*Result Type* must be a scalar or vector of [floating-point type](#).

*Float Value* must be a scalar or vector of [floating-point type](#). It must have the same number of components as *Result Type*. The component width cannot equal the component width in *Result Type*.

Results are computed per component.

4	115	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Float Value</i>
---	-----	---	--------------------------	---

<b>OpQuantizeToF16</b>  Quantize a floating-point value to what is expressible by a 16-bit floating-point value.  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> . The component width must be 32 bits.  <i>Value</i> is the value to quantize. The type of <i>Value</i> must be the same as <i>Result Type</i> .  If <i>Value</i> is an infinity, the result is the same infinity. If <i>Value</i> is a NaN, the result is a NaN, but not necessarily the same NaN. If <i>Value</i> is positive with a magnitude too large to represent as a 16-bit floating-point value, the result is positive infinity. If <i>Value</i> is negative with a magnitude too large to represent as a 16-bit floating-point value, the result is negative infinity. If the magnitude of <i>Value</i> is too small to represent as a normalized 16-bit floating-point value, the result may be either +0 or -0.  The <b>RelaxedPrecision Decoration</b> has no effect on this instruction.  Results are computed per component.			<a href="#">Capability:</a> <b>Shader</b>	
4	116	<id> <i>Result Type</i>	Result <id>	<id> <i>Value</i>

<b>OpConvertPtrToU</b>  Bit pattern-preserving conversion of a pointer to an unsigned scalar integer of possibly different bit width.  <i>Result Type</i> must be a scalar of <a href="#">integer type</a> , whose <i>Signedness</i> operand is 0.  <i>Pointer</i> must be a <a href="#">physical pointer type</a> . If the bit width of <i>Pointer</i> is smaller than that of <i>Result Type</i> , the conversion will zero extend <i>Pointer</i> . If the bit width of <i>Pointer</i> is larger than that of <i>Result Type</i> , the conversion will truncate <i>Pointer</i> . For same bit width <i>Pointer</i> and <i>Result Type</i> , this is the same as <a href="#">OpBitcast</a> .			<a href="#">Capability:</a> <b>Addresses, PhysicalStorageBufferAddresses</b>	
4	117	<id> <i>Result Type</i>	Result <id>	<id> <i>Pointer</i>

<b>OpSatConvertSToU</b>  Convert a signed integer to unsigned integer. Converted values outside the representable range of <i>Result Type</i> are clamped to the nearest representable value of <i>Result Type</i> .  <i>Result Type</i> must be a scalar or vector of integer type.  <i>Signed Value</i> must be a scalar or vector of integer type. It must have the same number of components as <i>Result Type</i> .  Results are computed per component.			<b>Capability:</b> <b>Kernel</b>	
4	118	<id> <i>Result Type</i>	Result <id>	<id> <i>Signed Value</i>

<b>OpSatConvertUToS</b>  Convert an unsigned integer to signed integer. Converted values outside the representable range of <i>Result Type</i> are clamped to the nearest representable value of <i>Result Type</i> .  <i>Result Type</i> must be a scalar or vector of <a href="#">integer type</a> .  <i>Unsigned Value</i> must be a scalar or vector of <a href="#">integer type</a> . It must have the same number of components as <i>Result Type</i> .  Results are computed per component.			Capability: <b>Kernel</b>	
4	119	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Unsigned Value</i>

<b>OpConvertUToPtr</b>  Bit pattern-preserving conversion of an unsigned scalar integer to a pointer.  <i>Result Type</i> must be a <a href="#">physical pointer type</a> .  <i>Integer Value</i> must be a scalar of <a href="#">integer type</a> , whose <i>Signedness</i> operand is 0. If the bit width of <i>Integer Value</i> is smaller than that of <i>Result Type</i> , the conversion will zero extend <i>Integer Value</i> . If the bit width of <i>Integer Value</i> is larger than that of <i>Result Type</i> , the conversion will truncate <i>Integer Value</i> . For same-width <i>Integer Value</i> and <i>Result Type</i> , this is the same as <a href="#">OpBitcast</a> .			Capability: <b>Addresses, PhysicalStorageBufferAddresses</b>	
4	120	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Integer Value</i>

<b>OpPtrCastToGeneric</b>  Convert a pointer's Storage Class to <b>Generic</b> .  <i>Result Type</i> must be an <a href="#">OpTypePointer</a> . Its <a href="#">Storage Class</a> must be <b>Generic</b> .  <i>Pointer</i> must point to the <b>Workgroup</b> , <b>CrossWorkgroup</b> , or <b>Function Storage Class</b> .  <i>Result Type</i> and <i>Pointer</i> must point to the same type.			Capability: <b>Kernel</b>	
4	121	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Pointer</i>

<b>OpGenericCastToPtr</b>  Convert a pointer's Storage Class to a non- <b>Generic</b> class.  <i>Result Type</i> must be an <b>OpTypePointer</b> . Its <b>Storage Class</b> must be <b>Workgroup</b> , <b>CrossWorkgroup</b> , or <b>Function</b> .  <i>Pointer</i> must point to the <b>Generic Storage Class</b> .  <i>Result Type</i> and <i>Pointer</i> must point to the same type.			<b>Capability:</b> <b>Kernel</b>	
4	122	<id> <i>Result Type</i>	Result <id>	<id> <i>Pointer</i>

<b>OpGenericCastToPtrExplicit</b>  Attempts to explicitly convert <i>Pointer</i> to <i>Storage</i> storage-class pointer value.  <i>Result Type</i> must be an <b>OpTypePointer</b> . Its <b>Storage Class</b> must be <i>Storage</i> .  <i>Pointer</i> must have a type of <b>OpTypePointer</b> whose <i>Type</i> is the same as the <i>Type</i> of <i>Result Type</i> . <i>Pointer</i> must point to the <b>Generic Storage Class</b> . If the cast fails, the instruction result is an <b>OpConstantNull</b> pointer in the <i>Storage Storage Class</i> .  <i>Storage</i> must be one of the following literal values from <b>Storage Class</b> : <b>Workgroup</b> , <b>CrossWorkgroup</b> , or <b>Function</b> .				<b>Capability:</b> <b>Kernel</b>	
5	123	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<id> <i>Pointer</i>	<b>Storage Class</b> <i>Storage</i>

**OpBitcast**

Bit pattern-preserving type conversion.

*Result Type* must be an [OpTypePointer](#), or a scalar or vector of [numerical-type](#).

*Operand* must have a type of [OpTypePointer](#), or a scalar or vector of [numerical-type](#). It must be a different type than *Result Type*.

Before **version 1.4**: If either *Result Type* or *Operand* is a pointer, the other must be a pointer or an integer scalar.  
Starting with **version 1.5**: If either *Result Type* or *Operand* is a pointer, the other must be a pointer, an integer scalar, or an integer vector.

If *Result Type* has the same number of components as *Operand*, they must also have the same component width, and results are computed per component.

If *Result Type* has a different number of components than *Operand*, the total number of bits in *Result Type* must equal the total number of bits in *Operand*. Let *L* be the type, either *Result Type* or *Operand's* type, that has the larger number of components. Let *S* be the other type, with the smaller number of components. The number of components in *L* must be an integer multiple of the number of components in *S*. The first component (that is, the only or lowest-numbered component) of *S* maps to the first components of *L*, and so on, up to the last component of *S* mapping to the last components of *L*. Within this mapping, any single component of *S* (mapping to multiple components of *L*) maps its lower-ordered bits to the lower-numbered components of *L*.

4	124	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Operand</i>
---	-----	----------------------------	-----------------------------------	------------------------

## 3.32.12 Composite Instructions

**OpVectorExtractDynamic**

Extract a single, dynamically selected, component of a vector.

*Result Type* must be a **scalar** type.

*Vector* must have a type **OpTypeVector** whose *Component Type* is *Result Type*.

*Index* must be a scalar **integer** 0-based index of which component of *Vector* to extract.

The value read is undefined if *Index*'s value is less than zero or greater than or equal to the number of components in *Vector*.

5	77	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<id> <i>Vector</i>	<id> <i>Index</i>
---	----	----------------------------	--------------------------	-----------------------	----------------------

**OpVectorInsertDynamic**

Make a copy of a vector, with a single, variably selected, component modified.

*Result Type* must be an **OpTypeVector**.

*Vector* must have the same type as *Result Type* and is the vector that the non-written components will be copied from.

*Component* is the value that will be supplied for the component selected by *Index*. It must have the same type as the type of components in *Result Type*.

*Index* must be a scalar **integer** 0-based index of which component to modify.

What is written is undefined if *Index*'s value is less than zero or greater than or equal to the number of components in *Vector*.

6	78	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<id> <i>Vector</i>	<id> <i>Component</i>	<id> <i>Index</i>
---	----	----------------------------	--------------------------	-----------------------	--------------------------	----------------------

**OpVectorShuffle**

Select arbitrary components from two vectors to make a new vector.

*Result Type* must be an [OpTypeVector](#). The number of components in *Result Type* must be the same as the number of *Component* operands.

*Vector 1* and *Vector 2* must both have vector types, with the same *Component Type* as *Result Type*. They do not have to have the same number of components as *Result Type* or with each other. They are logically concatenated, forming a single vector with *Vector 1*'s components appearing before *Vector 2*'s. The components of this logical vector are logically numbered with a single consecutive set of numbers from 0 to  $N - 1$ , where  $N$  is the total number of components.

*Components* are these logical numbers (see above), selecting which of the logically numbered components form the result. Each component is an unsigned 32-bit integer. They can select the components in any order and can repeat components. The first component of the result is selected by the first *Component* operand, the second component of the result is selected by the second *Component* operand, etc. A *Component literal* may also be FFFFFFFF, which means the corresponding result component has no source and is undefined. All *Component literals* must either be FFFFFFFF or in  $[0, N - 1]$  ([inclusive](#)).

**Note:** A vector “swizzle” can be done by using the vector for both *Vector* operands, or using an [OpUndef](#) for one of the *Vector* operands.

5 + variable	79	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Vector 1</i>	<id> <i>Vector 2</i>	<i>Literal, Literal,</i> ... <i>Components</i>
--------------	----	----------------------------	-----------------------------------	-------------------------	-------------------------	--

**OpCompositeConstruct**

Construct a new [composite](#) object from a set of constituent objects that will fully form it.

*Result Type* must be a [composite](#) type, whose top-level members/elements/components/columns have the same type as the types of the operands, with one exception. The exception is that for constructing a vector, the operands may also be vectors with the same component type as the *Result Type* component type. When constructing a vector, the total number of components in all the operands must equal the number of components in *Result Type*.

*Constituents* will become members of a structure, or elements of an array, or components of a vector, or columns of a matrix. There must be exactly one *Constituent* for each top-level member/element/component/column of the result, with one exception. The exception is that for constructing a vector, a contiguous subset of the scalars consumed can be represented by a vector operand instead. The *Constituents* must appear in the order needed by the definition of the type of the result. When constructing a vector, there must be at least two *Constituent* operands.

3 + variable	80	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id>, <id>, ... <i>Constituents</i>
--------------	----	----------------------------	-----------------------------------	--

**OpCompositeExtract**

Extract a part of a [composite](#) object.

*Result Type* must be the type of object selected by the last provided index. The instruction result is the extracted object.

*Composite* is the composite to extract from.

*Indexes* walk the type hierarchy, potentially down to component granularity, to select the part to extract. All indexes must be in bounds. All composite constituents use zero-based numbering, as described by their **OpType...** instruction. Each index is an unsigned 32-bit integer.

4 + variable	81	<id> <i>Result Type</i>	Result <id>	<id> <i>Composite</i>	<i>Literal, Literal, ... Indexes</i>
--------------	----	----------------------------	-------------	--------------------------	--

**OpCompositeInsert**

Make a copy of a [composite](#) object, while modifying one part of it.

*Result Type* must be the same type as *Composite*.

*Object* is the object to use as the modified part.

*Composite* is the composite to copy all but the modified part from.

*Indexes* walk the type hierarchy of *Composite* to the desired depth, potentially down to component granularity, to select the part to modify. All indexes must be in bounds. All composite constituents use zero-based numbering, as described by their **OpType...** instruction. The type of the part selected to modify must match the type of *Object*. Each index is an unsigned 32-bit integer.

5 + variable	82	<id> <i>Result Type</i>	Result <id>	<id> <i>Object</i>	<id> <i>Composite</i>	<i>Literal, Literal, ... Indexes</i>
--------------	----	----------------------------	-------------	-----------------------	--------------------------	--

**OpCopyObject**

Make a copy of *Operand*. There are no pointer dereferences involved.

*Result Type* must equal *Operand* type. There are no other restrictions on the types.

4	83	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand</i>
---	----	----------------------------	-------------	------------------------

<b>OpTranspose</b>  Transpose a matrix.  <i>Result Type</i> must be an <a href="#">OpTypeMatrix</a> .  <i>Matrix</i> must be an object of type <a href="#">OpTypeMatrix</a> . The number of columns and the column size of <i>Matrix</i> must be the reverse of those in <i>Result Type</i> . The types of the scalar components in <i>Matrix</i> and <i>Result Type</i> must be the same.  <i>Matrix</i> must have of type of <a href="#">OpTypeMatrix</a> .			<a href="#">Capability:</a> <b>Matrix</b>	
4	84	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Matrix</i>

<b>OpCopyLogical</b>  Make a logical copy of <i>Operand</i> . There are no pointer dereferences involved.  <i>Result Type</i> must not equal the type of <i>Operand</i> (see <a href="#">OpCopyObject</a> ), but <i>Result Type</i> must <i>logically match</i> the <i>Operand</i> type.  <i>Logically match</i> is recursively defined by these three rules: 1. They must be either both be <a href="#">OpTypeArray</a> or both be <a href="#">OpTypeStruct</a> 2. If they are <a href="#">OpTypeArray</a> : - they must have the same <i>Length</i> operand, and - their <i>Element Type</i> operands must be either the same or must <i>logically match</i> . 3. If they are <a href="#">OpTypeStruct</a> : - they must have the same number of <i>Member type</i> , and - <i>Member N type</i> for the same <i>N</i> in the two types must be either the same or must <i>logically match</i> .			<a href="#">Missing before version 1.4.</a>	
4	400	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Operand</i>

## 3.32.13 Arithmetic Instructions

**OpSNegate**

Signed-integer subtract of *Operand* from zero.

*Result Type* must be a scalar or vector of [integer type](#).

*Operand*'s type must be a scalar or vector of [integer type](#). It must have the same number of components as *Result Type*. The component width must equal the component width in *Result Type*.

Results are computed per component.

4	126	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand</i>
---	-----	----------------------------	-------------	------------------------

**OpFNegate**

Inverts the sign bit of *Operand*. (Note, however, that **OpFNegate** is still considered a floating-point instruction, and so is subject to the general floating-point rules regarding, for example, subnormals and NaN propagation).

*Result Type* must be a scalar or vector of [floating-point type](#).

The type of *Operand* must be the same as *Result Type*.

Results are computed per component.

4	127	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand</i>
---	-----	----------------------------	-------------	------------------------

**OpIAdd**

Integer addition of *Operand 1* and *Operand 2*.

*Result Type* must be a scalar or vector of [integer type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same number of components as *Result Type*. They must have the same component width as *Result Type*.

The resulting value will equal the low-order *N* bits of the correct result *R*, where *N* is the component width and *R* is computed with enough precision to avoid overflow and underflow.

Results are computed per component.

5	128	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFAdd**

Floating-point addition of *Operand 1* and *Operand 2*.

*Result Type* must be a scalar or vector of [floating-point type](#).

The types of *Operand 1* and *Operand 2* both must be the same as *Result Type*.

Results are computed per component.

5	129	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpISub**

Integer subtraction of *Operand 2* from *Operand 1*.

*Result Type* must be a scalar or vector of [integer type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same number of components as *Result Type*. They must have the same component width as *Result Type*.

The resulting value will equal the low-order *N* bits of the correct result *R*, where *N* is the component width and *R* is computed with enough precision to avoid overflow and underflow.

Results are computed per component.

5	130	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFSub**

Floating-point subtraction of *Operand 2* from *Operand 1*.

*Result Type* must be a scalar or vector of [floating-point type](#).

The types of *Operand 1* and *Operand 2* both must be the same as *Result Type*.

Results are computed per component.

5	131	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpIMul**

Integer multiplication of *Operand 1* and *Operand 2*.

*Result Type* must be a scalar or vector of [integer type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same number of components as *Result Type*. They must have the same component width as *Result Type*.

The resulting value will equal the low-order *N* bits of the correct result *R*, where *N* is the component width and *R* is computed with enough precision to avoid overflow and underflow.

Results are computed per component.

5	132	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-----------------------------------	--------------------------	--------------------------

**OpFMul**

Floating-point multiplication of *Operand 1* and *Operand 2*.

*Result Type* must be a scalar or vector of [floating-point type](#).

The types of *Operand 1* and *Operand 2* both must be the same as *Result Type*.

Results are computed per component.

5	133	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-----------------------------------	--------------------------	--------------------------

**OpUDiv**

Unsigned-integer division of *Operand 1* divided by *Operand 2*.

*Result Type* must be a scalar or vector of [integer type](#), whose *Signedness* operand is 0.

The types of *Operand 1* and *Operand 2* both must be the same as *Result Type*.

Results are computed per component. The resulting value is undefined if *Operand 2* is 0.

5	134	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-----------------------------------	--------------------------	--------------------------

**OpSDiv**

Signed-integer division of *Operand 1* divided by *Operand 2*.

*Result Type* must be a scalar or vector of [integer type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same number of components as *Result Type*. They must have the same component width as *Result Type*.

Results are computed per component. Behavior is undefined if *Operand 2* is 0, or if *Operand 2* is -1 and *Operand 1* is the minimum representable value for the operands' type, causing signed overflow.

5	135	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-----------------------------------	--------------------------	--------------------------

**OpFDiv**

Floating-point division of *Operand 1* divided by *Operand 2*.

*Result Type* must be a scalar or vector of [floating-point type](#).

The types of *Operand 1* and *Operand 2* both must be the same as *Result Type*.

Results are computed per component. The resulting value is undefined if *Operand 2* is 0.

5	136	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-----------------------------------	--------------------------	--------------------------

**OpUMod**

Unsigned modulo operation of *Operand 1* modulo *Operand 2*.

*Result Type* must be a scalar or vector of [integer type](#), whose *Signedness* operand is 0.

The types of *Operand 1* and *Operand 2* both must be the same as *Result Type*.

Results are computed per component. The resulting value is undefined if *Operand 2* is 0.

5	137	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-----------------------------------	--------------------------	--------------------------

**OpSRem**

Signed remainder operation for the remainder whose sign matches the sign of *Operand 1*.

*Result Type* must be a scalar or vector of [integer type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same number of components as *Result Type*. They must have the same component width as *Result Type*.

Results are computed per component. Behavior is undefined if *Operand 2* is 0, or if *Operand 2* is -1 and *Operand 1* is the minimum representable value for the operands' type, causing signed overflow. Otherwise, the result is the [remainder](#) *r* of *Operand 1* divided by *Operand 2* where if *r* ≠ 0, the sign of *r* is the same as the sign of *Operand 1*.

5	138	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpSMod**

Signed remainder operation for the remainder whose sign matches the sign of *Operand 2*.

*Result Type* must be a scalar or vector of [integer type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same number of components as *Result Type*. They must have the same component width as *Result Type*.

Results are computed per component. Behavior is undefined if *Operand 2* is 0, or if *Operand 2* is -1 and *Operand 1* is the minimum representable value for the operands' type, causing signed overflow. Otherwise, the result is the [remainder](#)  $r$  of *Operand 1* divided by *Operand 2* where if  $r \neq 0$ , the sign of  $r$  is the same as the sign of *Operand 2*.

5	139	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFRem**

The floating-point [remainder](#) whose sign matches the sign of *Operand 1*.

*Result Type* must be a scalar or vector of [floating-point type](#).

The types of *Operand 1* and *Operand 2* both must be the same as *Result Type*.

Results are computed per component. The resulting value is undefined if *Operand 2* is 0. Otherwise, the result is the [remainder](#)  $r$  of *Operand 1* divided by *Operand 2* where if  $r \neq 0$ , the sign of  $r$  is the same as the sign of *Operand 1*.

5	140	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFMod**

The floating-point [remainder](#) whose sign matches the sign of *Operand 2*.

*Result Type* must be a scalar or vector of [floating-point type](#).

The types of *Operand 1* and *Operand 2* both must be the same as *Result Type*.

Results are computed per component. The resulting value is undefined if *Operand 2* is 0. Otherwise, the result is the [remainder](#)  $r$  of *Operand 1* divided by *Operand 2* where if  $r \neq 0$ , the sign of  $r$  is the same as the sign of *Operand 2*.

5	141	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

<b>OpVectorTimesScalar</b>  Scale a floating-point vector.  <i>Result Type</i> must be a vector of <b>floating-point type</b> .  The type of <i>Vector</i> must be the same as <i>Result Type</i> . Each component of <i>Vector</i> is multiplied by <i>Scalar</i> .  <i>Scalar</i> must have the same type as the <i>Component Type</i> in <i>Result Type</i> .					
5	142	<id> <i>Result Type</i>	Result <id>	<id> <i>Vector</i>	<id> <i>Scalar</i>

<b>OpMatrixTimesScalar</b>  Scale a floating-point matrix.  <i>Result Type</i> must be an <b>OpTypeMatrix</b> whose <i>Column Type</i> is a vector of <b>floating-point type</b> .  The type of <i>Matrix</i> must be the same as <i>Result Type</i> . Each component in each column in <i>Matrix</i> is multiplied by <i>Scalar</i> .  <i>Scalar</i> must have the same type as the <i>Component Type</i> in <i>Result Type</i> .				<b>Capability:</b> <b>Matrix</b>	
5	143	<id> <i>Result Type</i>	Result <id>	<id> <i>Matrix</i>	<id> <i>Scalar</i>

<b>OpVectorTimesMatrix</b>  Linear-algebraic <i>Vector X Matrix</i> .  <i>Result Type</i> must be a vector of <b>floating-point type</b> .  <i>Vector</i> must be a vector with the same <i>Component Type</i> as the <i>Component Type</i> in <i>Result Type</i> . Its number of components must equal the number of components in each column in <i>Matrix</i> .  <i>Matrix</i> must be a matrix with the same <i>Component Type</i> as the <i>Component Type</i> in <i>Result Type</i> . Its number of columns must equal the number of components in <i>Result Type</i> .				<b>Capability:</b> <b>Matrix</b>	
5	144	<id> <i>Result Type</i>	Result <id>	<id> <i>Vector</i>	<id> <i>Matrix</i>

<b>OpMatrixTimesVector</b>  Linear-algebraic <i>Matrix X Vector</i> .  <i>Result Type</i> must be a vector of <b>floating-point type</b> .  <i>Matrix</i> must be an <b>OpTypeMatrix</b> whose <i>Column Type</i> is <i>Result Type</i> .  <i>Vector</i> must be a vector with the same <i>Component Type</i> as the <i>Component Type</i> in <i>Result Type</i> . Its number of components must equal the number of columns in <i>Matrix</i> .				<b>Capability:</b> <b>Matrix</b>	
5	145	<id> <i>Result Type</i>	Result <id>	<id> <i>Matrix</i>	<id> <i>Vector</i>

<b>OpMatrixTimesMatrix</b>  Linear-algebraic multiply of <i>LeftMatrix X RightMatrix</i> .  <i>Result Type</i> must be an <b>OpTypeMatrix</b> whose <i>Column Type</i> is a vector of <b>floating-point type</b> .  <i>LeftMatrix</i> must be a matrix whose <i>Column Type</i> is the same as the <i>Column Type</i> in <i>Result Type</i> .  <i>RightMatrix</i> must be a matrix with the same <i>Component Type</i> as the <i>Component Type</i> in <i>Result Type</i> . Its number of columns must equal the number of columns in <i>Result Type</i> . Its columns must have the same number of components as the number of columns in <i>LeftMatrix</i> .				<b>Capability:</b> <b>Matrix</b>	
5	146	<id> <i>Result Type</i>	Result <id>	<id> <i>LeftMatrix</i>	<id> <i>RightMatrix</i>

<b>OpOuterProduct</b>  Linear-algebraic outer product of <i>Vector 1</i> and <i>Vector 2</i> .  <i>Result Type</i> must be an <b>OpTypeMatrix</b> whose <i>Column Type</i> is a vector of <b>floating-point type</b> .  <i>Vector 1</i> must have the same type as the <i>Column Type</i> in <i>Result Type</i> .  <i>Vector 2</i> must be a vector with the same <i>Component Type</i> as the <i>Component Type</i> in <i>Result Type</i> . Its number of components must equal the number of columns in <i>Result Type</i> .				<b>Capability:</b> <b>Matrix</b>	
5	147	<id> <i>Result Type</i>	Result <id>	<id> <i>Vector 1</i>	<id> <i>Vector 2</i>

**OpDot**

Dot product of *Vector 1* and *Vector 2*.

*Result Type* must be a [floating-point type](#) scalar.

*Vector 1* and *Vector 2* must be vectors of the same type, and their component type must be *Result Type*.

5	148	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Vector 1</i>	<id> <i>Vector 2</i>
---	-----	----------------------------	-----------------------------------	-------------------------	-------------------------

**OpIAddCarry**

Result is the unsigned integer addition of *Operand 1* and *Operand 2*, including its carry.

*Result Type* must be from [OpTypeStruct](#). The struct must have two members, and the two members must be the same type. The member type must be a scalar or vector of [integer type](#), whose *Signedness* operand is 0.

*Operand 1* and *Operand 2* must have the same type as the members of *Result Type*. These are consumed as unsigned integers.

Results are computed per component.

Member 0 of the result gets the low-order bits (full component width) of the addition.

Member 1 of the result gets the high-order (carry) bit of the result of the addition. That is, it gets the value 1 if the addition overflowed the component width, and 0 otherwise.

5	149	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-----------------------------------	--------------------------	--------------------------

**OpISubBorrow**

Result is the unsigned integer subtraction of *Operand 2* from *Operand 1*, and what it needed to borrow.

*Result Type* must be from [OpTypeStruct](#). The struct must have two members, and the two members must be the same type. The member type must be a scalar or vector of [integer type](#), whose *Signedness* operand is 0.

*Operand 1* and *Operand 2* must have the same type as the members of *Result Type*. These are consumed as unsigned integers.

Results are computed per component.

Member 0 of the result gets the low-order bits (full component width) of the subtraction. That is, if *Operand 1* is larger than *Operand 2*, member 0 gets the full value of the subtraction; if *Operand 2* is larger than *Operand 1*, member 0 gets  $2^w + \text{Operand 1} - \text{Operand 2}$ , where  $w$  is the component width.

Member 1 of the result gets 0 if  $\text{Operand 1} \geq \text{Operand 2}$ , and gets 1 otherwise.

5	150	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-----------------------------------	--------------------------	--------------------------

**OpUMulExtended**

Result is the full value of the unsigned integer multiplication of *Operand 1* and *Operand 2*.

*Result Type* must be from [OpTypeStruct](#). The struct must have two members, and the two members must be the same type. The member type must be a scalar or vector of [integer type](#), whose *Signedness* operand is 0.

*Operand 1* and *Operand 2* must have the same type as the members of *Result Type*. These are consumed as unsigned integers.

Results are computed per component.

Member 0 of the result gets the low-order bits of the multiplication.

Member 1 of the result gets the high-order bits of the multiplication.

5	151	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-----------------------------------	--------------------------	--------------------------

**OpSMulExtended**

Result is the full value of the signed integer multiplication of *Operand 1* and *Operand 2*.

*Result Type* must be from [OpTypeStruct](#). The struct must have two members, and the two members must be the same type. The member type must be a scalar or vector of [integer type](#).

*Operand 1* and *Operand 2* must have the same type as the members of *Result Type*. These are consumed as signed integers.

Results are computed per component.

Member 0 of the result gets the low-order bits of the multiplication.

Member 1 of the result gets the high-order bits of the multiplication.

5	152	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-----------------------------------	--------------------------	--------------------------

## 3.32.14 Bit Instructions

**OpShiftRightLogical**

Shift the bits in *Base* right by the number of bits specified in *Shift*. The most-significant bits will be zero filled.

*Result Type* must be a scalar or vector of [integer type](#).

The type of each *Base* and *Shift* must be a scalar or vector of [integer type](#). *Base* and *Shift* must have the same number of components. The number of components and bit width of the type of *Base* must be the same as in *Result Type*.

*Shift* is consumed as an unsigned integer. The result is undefined if *Shift* is greater than or equal to the bit width of the components of *Base*.

Results are computed per component.

5	194	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Base</i>	<i>&lt;id&gt;</i> <i>Shift</i>
---	-----	---	--------------------------	----------------------------------	-----------------------------------

**OpShiftRightArithmetic**

Shift the bits in *Base* right by the number of bits specified in *Shift*. The most-significant bits will be filled with the sign bit from *Base*.

*Result Type* must be a scalar or vector of [integer type](#).

The type of each *Base* and *Shift* must be a scalar or vector of [integer type](#). *Base* and *Shift* must have the same number of components. The number of components and bit width of the type of *Base* must be the same as in *Result Type*.

*Shift* is treated as unsigned. The result is undefined if *Shift* is greater than or equal to the bit width of the components of *Base*.

Results are computed per component.

5	195	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Base</i>	<i>&lt;id&gt;</i> <i>Shift</i>
---	-----	---	--------------------------	----------------------------------	-----------------------------------

**OpShiftLeftLogical**

Shift the bits in *Base* left by the number of bits specified in *Shift*. The least-significant bits will be zero filled.

*Result Type* must be a scalar or vector of [integer type](#).

The type of each *Base* and *Shift* must be a scalar or vector of [integer type](#). *Base* and *Shift* must have the same number of components. The number of components and bit width of the type of *Base* must be the same as in *Result Type*.

*Shift* is treated as unsigned. The result is undefined if *Shift* is greater than or equal to the bit width of the components of *Base*.

The number of components and bit width of *Result Type* must match those *Base* type. All types must be integer types.

Results are computed per component.

5	196	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Base</i>	<i>&lt;id&gt;</i> <i>Shift</i>
---	-----	---	--------------------------	----------------------------------	-----------------------------------

**OpBitwiseOr**

Result is 1 if either *Operand 1* or *Operand 2* is 1. Result is 0 if both *Operand 1* and *Operand 2* are 0.

Results are computed per component, and within each component, per bit.

*Result Type* must be a scalar or vector of [integer type](#). The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same number of components as *Result Type*. They must have the same component width as *Result Type*.

5	197	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpBitwiseXor**

Result is 1 if exactly one of *Operand 1* or *Operand 2* is 1. Result is 0 if *Operand 1* and *Operand 2* have the same value.

Results are computed per component, and within each component, per bit.

*Result Type* must be a scalar or vector of [integer type](#). The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same number of components as *Result Type*. They must have the same component width as *Result Type*.

5	198	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpBitwiseAnd**

Result is 1 if both *Operand 1* and *Operand 2* are 1. Result is 0 if either *Operand 1* or *Operand 2* are 0.

Results are computed per component, and within each component, per bit.

*Result Type* must be a scalar or vector of [integer type](#). The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same number of components as *Result Type*. They must have the same component width as *Result Type*.

5	199	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpNot**

Complement the bits of *Operand*.

Results are computed per component, and within each component, per bit.

*Result Type* must be a scalar or vector of [integer type](#).

*Operand's* type must be a scalar or vector of [integer type](#). It must have the same number of components as *Result Type*. The component width must equal the component width in *Result Type*.

4	200	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand</i>
---	-----	----------------------------	-------------	------------------------

<b>OpBitFieldInsert</b>  Make a copy of an object, with a modified bit field that comes from another object.  Results are computed per component.  <i>Result Type</i> must be a scalar or vector of <b>integer type</b> .  The type of <i>Base</i> and <i>Insert</i> must be the same as <i>Result Type</i> .  Any result bits numbered outside [ <i>Offset</i> , <i>Offset</i> + <i>Count</i> - 1] ( <b>inclusive</b> ) will come from the corresponding bits in <i>Base</i> .  Any result bits numbered in [ <i>Offset</i> , <i>Offset</i> + <i>Count</i> - 1] come, in order, from the bits numbered [0, <i>Count</i> - 1] of <i>Insert</i> .  <i>Count</i> must be an <b>integer type</b> scalar. <i>Count</i> is the number of bits taken from <i>Insert</i> . It will be consumed as an unsigned value. <i>Count</i> can be 0, in which case the result will be <i>Base</i> .  <i>Offset</i> must be an <b>integer type</b> scalar. <i>Offset</i> is the lowest-order bit of the bit field. It will be consumed as an unsigned value.  The resulting value is undefined if <i>Count</i> or <i>Offset</i> or their sum is greater than the number of bits in the result.				<b>Capability:</b> <b>Shader</b>			
7	201	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<id> <i>Base</i>	<id> <i>Insert</i>	<id> <i>Offset</i>	<id> <i>Count</i>

<b>OpBitFieldSExtract</b>  Extract a bit field from an object, with sign extension.  Results are computed per component.  <i>Result Type</i> must be a scalar or vector of <a href="#">integer type</a> .  The type of <i>Base</i> must be the same as <i>Result Type</i> .  If <i>Count</i> is greater than 0: The bits of <i>Base</i> numbered in [ <i>Offset</i> , <i>Offset</i> + <i>Count</i> - 1] ( <a href="#">inclusive</a> ) become the bits numbered [0, <i>Count</i> - 1] of the result. The remaining bits of the result will all be the same as bit <i>Offset</i> + <i>Count</i> - 1 of <i>Base</i> .  <i>Count</i> must be an <a href="#">integer type</a> scalar. <i>Count</i> is the number of bits extracted from <i>Base</i> . It will be consumed as an unsigned value. <i>Count</i> can be 0, in which case the result will be 0.  <i>Offset</i> must be an <a href="#">integer type</a> scalar. <i>Offset</i> is the lowest-order bit of the bit field to extract from <i>Base</i> . It will be consumed as an unsigned value.  The resulting value is undefined if <i>Count</i> or <i>Offset</i> or their sum is greater than the number of bits in the result.				<b>Capability:</b> <b>Shader</b>		
6	202	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Base</i>	<id> <i>Offset</i>	<id> <i>Count</i>

<b>OpBitFieldUExtract</b>  Extract a bit field from an object, without sign extension.  The semantics are the same as with <a href="#">OpBitFieldSExtract</a> with the exception that there is no sign extension. The remaining bits of the result will all be 0.				<b>Capability:</b> <b>Shader</b>		
6	203	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Base</i>	<id> <i>Offset</i>	<id> <i>Count</i>

<b>OpBitReverse</b>  Reverse the bits in an object.  Results are computed per component.  <i>Result Type</i> must be a scalar or vector of <a href="#">integer type</a> .  The type of <i>Base</i> must be the same as <i>Result Type</i> .  The bit-number <i>n</i> of the result will be taken from bit-number <i>Width</i> - 1 - <i>n</i> of <i>Base</i> , where <i>Width</i> is the <a href="#">OpTypeInt</a> operand of the <i>Result Type</i> .				<b>Capability:</b> <b>Shader</b>		
4	204	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Base</i>		

**OpBitCount**

Count the number of set bits in an object.

Results are computed per component.

*Result Type* must be a scalar or vector of [integer type](#). The components must be wide enough to hold the unsigned *Width* of *Base* as an unsigned value. That is, no sign bit is needed or counted when checking for a wide enough result width.

*Base* must be a scalar or vector of [integer type](#). It must have the same number of components as *Result Type*.

The result is the unsigned value that is the number of bits in *Base* that are 1.

4	205	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<i>&lt;id&gt;</i> <i>Base</i>
---	-----	---	-----------------------------------	----------------------------------

## 3.32.15 Relational and Logical Instructions

**OpAny**

Result is **true** if any component of *Vector* is **true**, otherwise result is **false**.

*Result Type* must be a **Boolean type** scalar.

*Vector* must be a vector of **Boolean type**.

4	154	<id> <i>Result Type</i>	Result <id>	<id> <i>Vector</i>
---	-----	----------------------------	-------------	-----------------------

**OpAll**

Result is **true** if all components of *Vector* are **true**, otherwise result is **false**.

*Result Type* must be a **Boolean type** scalar.

*Vector* must be a vector of **Boolean type**.

4	155	<id> <i>Result Type</i>	Result <id>	<id> <i>Vector</i>
---	-----	----------------------------	-------------	-----------------------

**OpIsNan**

Result is **true** if *x* is an IEEE NaN, otherwise result is **false**.

*Result Type* must be a scalar or vector of **Boolean type**.

*x* must be a scalar or vector of **floating-point type**. It must have the same number of components as *Result Type*.

Results are computed per component.

4	156	<id> <i>Result Type</i>	Result <id>	<id> <i>x</i>
---	-----	----------------------------	-------------	------------------

**OpIsInf**

Result is **true** if *x* is an IEEE Inf, otherwise result is **false**

*Result Type* must be a scalar or vector of **Boolean type**.

*x* must be a scalar or vector of **floating-point type**. It must have the same number of components as *Result Type*.

Results are computed per component.

4	157	<id> <i>Result Type</i>	Result <id>	<id> <i>x</i>
---	-----	----------------------------	-------------	------------------

<b>OpIsFinite</b>  Result is <b>true</b> if $x$ is an IEEE finite number, otherwise result is <b>false</b> .  <i>Result Type</i> must be a scalar or vector of <b>Boolean type</b> .  $x$ must be a scalar or vector of <b>floating-point type</b> . It must have the same number of components as <i>Result Type</i> .  Results are computed per component.			Capability: <b>Kernel</b>	
4	158	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> $x$

<b>OpIsNormal</b>  Result is <b>true</b> if $x$ is an IEEE normal number, otherwise result is <b>false</b> .  <i>Result Type</i> must be a scalar or vector of <b>Boolean type</b> .  $x$ must be a scalar or vector of <b>floating-point type</b> . It must have the same number of components as <i>Result Type</i> .  Results are computed per component.			Capability: <b>Kernel</b>	
4	159	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> $x$

<b>OpSignBitSet</b>  Result is <b>true</b> if $x$ has its sign bit set, otherwise result is <b>false</b> .  <i>Result Type</i> must be a scalar or vector of <b>Boolean type</b> .  $x$ must be a scalar or vector of <b>floating-point type</b> . It must have the same number of components as <i>Result Type</i> .  Results are computed per component.			Capability: <b>Kernel</b>	
4	160	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> $x$

<b>OpLessOrGreater</b>  <a href="#">Deprecated</a> (use <a href="#">OpFOrdNotEqual</a> ).  Has the same semantics as <a href="#">OpFOrdNotEqual</a> .  <i>Result Type</i> must be a scalar or vector of <a href="#">Boolean type</a> .  <i>x</i> must be a scalar or vector of <a href="#">floating-point type</a> . It must have the same number of components as <i>Result Type</i> .  <i>y</i> must have the same type as <i>x</i> .  Results are computed per component.				<a href="#">Capability:</a> <b>Kernel</b>	
5	161	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>x</i>	<i>&lt;id&gt;</i> <i>y</i>

<b>OpOrdered</b>  Result is <b>true</b> if both $x == x$ and $y == y$ are <b>true</b> , where IEEE comparison is used, otherwise result is <b>false</b> .  <i>Result Type</i> must be a scalar or vector of <a href="#">Boolean type</a> .  <i>x</i> must be a scalar or vector of <a href="#">floating-point type</a> . It must have the same number of components as <i>Result Type</i> .  <i>y</i> must have the same type as <i>x</i> .  Results are computed per component.				<a href="#">Capability:</a> <b>Kernel</b>	
5	162	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>x</i>	<i>&lt;id&gt;</i> <i>y</i>

<b>OpUnordered</b>  Result is <b>true</b> if either <i>x</i> or <i>y</i> is an IEEE NaN, otherwise result is <b>false</b> .  <i>Result Type</i> must be a scalar or vector of <a href="#">Boolean type</a> .  <i>x</i> must be a scalar or vector of <a href="#">floating-point type</a> . It must have the same number of components as <i>Result Type</i> .  <i>y</i> must have the same type as <i>x</i> .  Results are computed per component.				<a href="#">Capability:</a> <b>Kernel</b>	
5	163	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>x</i>	<i>&lt;id&gt;</i> <i>y</i>

**OpLogicalEqual**

Result is **true** if *Operand 1* and *Operand 2* have the same value. Result is **false** if *Operand 1* and *Operand 2* have different values.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* must be the same as *Result Type*.

The type of *Operand 2* must be the same as *Result Type*.

Results are computed per component.

5	164	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Operand 1</i>	<i>&lt;id&gt;</i> <i>Operand 2</i>
---	-----	---	--------------------------	---------------------------------------	---------------------------------------

**OpLogicalNotEqual**

Result is **true** if *Operand 1* and *Operand 2* have different values. Result is **false** if *Operand 1* and *Operand 2* have the same value.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* must be the same as *Result Type*.

The type of *Operand 2* must be the same as *Result Type*.

Results are computed per component.

5	165	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Operand 1</i>	<i>&lt;id&gt;</i> <i>Operand 2</i>
---	-----	---	--------------------------	---------------------------------------	---------------------------------------

**OpLogicalOr**

Result is **true** if either *Operand 1* or *Operand 2* is **true**. Result is **false** if both *Operand 1* and *Operand 2* are **false**.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* must be the same as *Result Type*.

The type of *Operand 2* must be the same as *Result Type*.

Results are computed per component.

5	166	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>Operand 1</i>	<i>&lt;id&gt;</i> <i>Operand 2</i>
---	-----	---	--------------------------	---------------------------------------	---------------------------------------

**OpLogicalAnd**

Result is **true** if both *Operand 1* and *Operand 2* are **true**. Result is **false** if either *Operand 1* or *Operand 2* are **false**.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* must be the same as *Result Type*.

The type of *Operand 2* must be the same as *Result Type*.

Results are computed per component.

5	167	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpLogicalNot**

Result is **true** if *Operand* is **false**. Result is **false** if *Operand* is **true**.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand* must be the same as *Result Type*.

Results are computed per component.

4	168	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand</i>
---	-----	----------------------------	-------------	------------------------

**OpSelect**

Select between two objects. Before **version 1.4**, results are only computed per component.

Before **version 1.4**, *Result Type* must be a pointer, scalar, or vector. Starting with **version 1.4**, *Result Type* can additionally be a [composite](#) type other than a vector.

The types of *Object 1* and *Object 2* must be the same as *Result Type*.

*Condition* must be a scalar or vector of [Boolean type](#).

If *Condition* is a scalar and **true**, the result is *Object 1*. If *Condition* is a scalar and **false**, the result is *Object 2*.

If *Condition* is a vector, *Result Type* must be a vector with the same number of components as *Condition* and the result is a mix of *Object 1* and *Object 2*: When a component of *Condition* is **true**, the corresponding component in the result is taken from *Object 1*, otherwise it is taken from *Object 2*.

6	169	<id> <i>Result Type</i>	Result <id>	<id> <i>Condition</i>	<id> <i>Object 1</i>	<id> <i>Object 2</i>
---	-----	----------------------------	-------------	--------------------------	-------------------------	-------------------------

**OpIEqual**

Integer comparison for equality.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same component width, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	170	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpINotEqual**

Integer comparison for inequality.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same component width, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	171	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpUGreaterThan**

Unsigned-integer comparison if *Operand 1* is greater than *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same component width, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	172	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpSGreaterThan**

Signed-integer comparison if *Operand 1* is greater than *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same component width, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	173	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpUGreaterThanEqual**

Unsigned-integer comparison if *Operand 1* is greater than or equal to *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same component width, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	174	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpSGreaterThanEqual**

Signed-integer comparison if *Operand 1* is greater than or equal to *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same component width, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	175	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpULessThan**

Unsigned-integer comparison if *Operand 1* is less than *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same component width, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	176	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpSLessThan**

Signed-integer comparison if *Operand 1* is less than *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same component width, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	177	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpULessThanEqual**

Unsigned-integer comparison if *Operand 1* is less than or equal to *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same component width, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	178	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpSLessThanEqual**

Signed-integer comparison if *Operand 1* is less than or equal to *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [integer type](#). They must have the same component width, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	179	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFOrdEqual**

Floating-point comparison for being ordered and equal.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [floating-point type](#). They must have the same type, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	180	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFUnordEqual**

Floating-point comparison for being unordered or equal.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [floating-point type](#). They must have the same type, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	181	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFOrdNotEqual**

Floating-point comparison for being ordered and not equal.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [floating-point type](#). They must have the same type, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	182	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFUnordNotEqual**

Floating-point comparison for being unordered or not equal.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [floating-point type](#). They must have the same type, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	183	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFOrdLessThan**

Floating-point comparison if operands are ordered and *Operand 1* is less than *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [floating-point type](#). They must have the same type, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	184	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFUnordLessThan**

Floating-point comparison if operands are unordered or *Operand 1* is less than *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [floating-point type](#). They must have the same type, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	185	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFOrdGreaterThan**

Floating-point comparison if operands are ordered and *Operand 1* is greater than *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [floating-point type](#). They must have the same type, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	186	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFUnordGreaterThan**

Floating-point comparison if operands are unordered or *Operand 1* is greater than *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [floating-point type](#). They must have the same type, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	187	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFOrdLessThanEqual**

Floating-point comparison if operands are ordered and *Operand 1* is less than or equal to *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [floating-point type](#). They must have the same type, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	188	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFUnordLessThanEqual**

Floating-point comparison if operands are unordered or *Operand 1* is less than or equal to *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [floating-point type](#). They must have the same type, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	189	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFOrdGreaterThanEqual**

Floating-point comparison if operands are ordered and *Operand 1* is greater than or equal to *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [floating-point type](#). They must have the same type, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	190	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

**OpFUnordGreaterThanEqual**

Floating-point comparison if operands are unordered or *Operand 1* is greater than or equal to *Operand 2*.

*Result Type* must be a scalar or vector of [Boolean type](#).

The type of *Operand 1* and *Operand 2* must be a scalar or vector of [floating-point type](#). They must have the same type, and they must have the same number of components as *Result Type*.

Results are computed per component.

5	191	<id> <i>Result Type</i>	Result <id>	<id> <i>Operand 1</i>	<id> <i>Operand 2</i>
---	-----	----------------------------	-------------	--------------------------	--------------------------

## 3.32.16 Derivative Instructions

<b>OpDPdx</b>  Same result as either <a href="#">OpDPdxFine</a> or <a href="#">OpDPdxCoarse</a> on <i>P</i> . Selection of which one is based on external factors.  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> . The component width must be 32 bits.  The type of <i>P</i> must be the same as <i>Result Type</i> . <i>P</i> is the value to take the derivative of.  This instruction is only valid in the <b>Fragment Execution Model</b> .			<a href="#">Capability:</a> <b>Shader</b>	
4	207	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>P</i>

  

<b>OpDPdy</b>  Same result as either <a href="#">OpDPdyFine</a> or <a href="#">OpDPdyCoarse</a> on <i>P</i> . Selection of which one is based on external factors.  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> . The component width must be 32 bits.  The type of <i>P</i> must be the same as <i>Result Type</i> . <i>P</i> is the value to take the derivative of.  This instruction is only valid in the <b>Fragment Execution Model</b> .			<a href="#">Capability:</a> <b>Shader</b>	
4	208	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> <i>P</i>

  

<b>OpFwidth</b>  Result is the same as computing the sum of the absolute values of <a href="#">OpDPdx</a> and <a href="#">OpDPdy</a> on <i>P</i> .  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> . The component width must be 32 bits.  The type of <i>P</i> must be the same as <i>Result Type</i> . <i>P</i> is the value to take the derivative of.  This instruction is only valid in the <b>Fragment Execution Model</b> .			<a href="#">Capability:</a> <b>Shader</b>	
--	--	--	--	--

4	209	<i>&lt;id&gt; Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt; P</i>
---	-----	-----------------------------------	--------------------------	-------------------------

<b>OpDPdxFine</b>  Result is the partial derivative of $P$ with respect to the window $x$ coordinate. Will use local differencing based on the value of $P$ for the current fragment and its immediate neighbor(s).  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> . The component width must be 32 bits.  The type of $P$ must be the same as <i>Result Type</i> . $P$ is the value to take the derivative of.  This instruction is only valid in the <b>Fragment Execution Model</b> .			<a href="#">Capability:</a> <b>DerivativeControl</b>	
4	210	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> $P$

<b>OpDPdyFine</b>  Result is the partial derivative of $P$ with respect to the window $y$ coordinate. Will use local differencing based on the value of $P$ for the current fragment and its immediate neighbor(s).  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> . The component width must be 32 bits.  The type of $P$ must be the same as <i>Result Type</i> . $P$ is the value to take the derivative of.  This instruction is only valid in the <b>Fragment Execution Model</b> .			<a href="#">Capability:</a> <b>DerivativeControl</b>	
4	211	<i>&lt;id&gt;</i> <i>Result Type</i>	Result <i>&lt;id&gt;</i>	<i>&lt;id&gt;</i> $P$

<p><b>OpFwidthFine</b></p> <p>Result is the same as computing the sum of the absolute values of <a href="#">OpDPdxFine</a> and <a href="#">OpDPdyFine</a> on <i>P</i>.</p> <p><i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a>. ## 3.32.17 Control-Flow Instructions

**OpPhi**

The SSA phi function.

The result is selected based on control flow: If control reached the current block from *Parent i*, *Result Id* gets the value that *Variable i* had at the end of *Parent i*.

*Result Type* can be any type.

Operands are a sequence of pairs: (*Variable 1*, *Parent 1* block), (*Variable 2*, *Parent 2* block), ... Each *Parent i* block is the label of an immediate predecessor in the CFG of the current block. There must be exactly one *Parent i* for each parent block of the current block in the CFG. If *Parent i* is reachable in the CFG and *Variable i* is defined in a block, that defining block must dominate *Parent i*. All *Variables* must have a type matching *Result Type*.

Within a block, this instruction must appear before all non-**OpPhi** instructions (except for **OpLine**, which can be mixed with **OpPhi**).

3 + variable	245	<id> <i>Result Type</i>	Result <id>	<id>, <id>, ... <i>Variable, Parent, ...</i>
--------------	-----	----------------------------	-------------	---

**OpLoopMerge**

Declare a structured loop.

This instruction must immediately precede either an **OpBranch** or **OpBranchConditional** instruction. That is, it must be the second-to-last instruction in its block.

*Merge Block* is the label of the merge block for this structured loop.

*Continue Target* is the label of a block targeted for processing a loop "continue".

*Loop Control Parameters* appear in **Loop Control**-table order for any *Loop Control* setting that requires such a parameter.

See **Structured Control Flow** for more detail.

4 + variable	246	<id> <i>Merge Block</i>	<id> <i>Continue Target</i>	Loop Control	<i>Literal, Literal, ...</i> <i>Loop Control</i> <i>Parameters</i>
--------------	-----	----------------------------	--------------------------------	--------------	--

**OpSelectionMerge**

Declare a structured selection.

This instruction must immediately precede either an [OpBranchConditional](#) or [OpSwitch](#) instruction. That is, it must be the second-to-last instruction in its block.

*Merge Block* is the label of the merge block for this structured selection.

See [Structured Control Flow](#) for more detail.

3	247	<i>&lt;id&gt;</i> <i>Merge Block</i>	<a href="#">Selection Control</a>
---	-----	---	-----------------------------------

**OpLabel**

The block label instruction: Any reference to a block is through the *Result <id>* of its label.

Must be the first instruction of any block, and appears only as the first instruction of a block.

2	248	<a href="#">Result &lt;id&gt;</a>
---	-----	-----------------------------------

**OpBranch**

Unconditional branch to *Target Label*.

*Target Label* must be the *Result <id>* of an [OpLabel](#) instruction in the current function.

This instruction must be the last instruction in a block.

2	249	<i>&lt;id&gt;</i> <i>Target Label</i>
---	-----	--

**OpBranchConditional**

If *Condition* is **true**, branch to *True Label*, otherwise branch to *False Label*.

*Condition* must be a **Boolean type** scalar.

*True Label* must be an **OpLabel** in the current function.

*False Label* must be an **OpLabel** in the current function.

*Branch weights* are unsigned 32-bit integer literals. There must be either no *Branch Weights* or exactly two branch weights. If present, the first is the weight for branching to *True Label*, and the second is the weight for branching to *False Label*. The implied probability that a branch is taken is its weight divided by the sum of the two *Branch weights*. At least one weight must be non-zero. A weight of zero does not imply a branch is dead or permit its removal; branch weights are only hints. The two weights must not overflow a 32-bit unsigned integer when added together.

This instruction must be the last instruction in a block.

4 + variable	250	<id> <i>Condition</i>	<id> <i>True Label</i>	<id> <i>False Label</i>	<i>Literal, Literal, ... Branch weights</i>
--------------	-----	--------------------------	---------------------------	----------------------------	---

**OpSwitch**

Multi-way branch to one of the operand label <id>.

*Selector* must have a type of **OpTypeInt**. *Selector* will be compared for equality to the *Target* literals.

*Default* must be the <id> of a label. If *Selector* does not equal any of the *Target* literals, control flow will branch to the *Default* label <id>.

*Target* must be alternating scalar integer *literals* and the <id> of a label. If *Selector* equals a *literal*, control flow will branch to the following *label* <id>. It is invalid for any two *literal* to be equal to each other. If *Selector* does not equal any *literal*, control flow will branch to the *Default* label <id>. Each *literal* is interpreted with the type of *Selector*: The bit width of *Selector*'s type will be the width of each *literal*'s type. If this width is not a multiple of 32-bits, the *literals* must be sign extended when the **OpTypeInt Signedness** is set to 1.

This instruction must be the last instruction in a block.

3 + variable	251	<id> <i>Selector</i>	<id> <i>Default</i>	<i>literal, label &lt;id&gt;, literal, label &lt;id&gt;, ... Target</i>
--------------	-----	-------------------------	------------------------	---

<b>OpKill</b>  Fragment-shader discard.  Ceases all further processing in any <a href="#">invocation</a> that executes it: Only instructions these invocations executed before <b>OpKill</b> will have observable side effects. If this instruction is executed in non- <a href="#">uniform control flow</a> , all subsequent control flow is non-uniform (for invocations that continue to execute).  This instruction must be the last instruction in a block.  This instruction is only valid in the <b>Fragment Execution Model</b> .		<a href="#">Capability:</a> <b>Shader</b>
1		252

<b>OpReturn</b>  Return with no value from a function with void return type.  This instruction must be the last instruction in a block.	
1	253

<b>OpReturnValue</b>  Return a value from a function.  <i>Value</i> is the value returned, by copy, and must match the <i>Return Type</i> operand of the <a href="#">OpTypeFunction</a> type of the <a href="#">OpFunction</a> body this return instruction is in.  This instruction must be the last instruction in a block.		
2	254	<i>&lt;id&gt;</i> <i>Value</i>

<b>OpUnreachable</b>  Declares that this block is not reachable in the CFG.  This instruction must be the last instruction in a block.	
1	255

<b>OpLifetimeStart</b>  Declare that an object was not defined before this instruction.  <i>Pointer</i> is a pointer to the object whose lifetime is starting. Its type must be an <b>OpTypePointer</b> with <b>Storage Class Function</b> .  <i>Size</i> is an unsigned 32-bit integer. <i>Size</i> must be 0 if <i>Pointer</i> is a pointer to a non-void type or the <b>Addresses capability</b> is not being used. If <i>Size</i> is non-zero, it is the number of bytes of memory whose lifetime is starting.			<b>Capability:</b> <b>Kernel</b>
3	256	<i>&lt;id&gt;</i> <i>Pointer</i>	<b>Literal</b> <i>Size</i>

<b>OpLifetimeStop</b>  Declare that an object is dead after this instruction.  <i>Pointer</i> is a pointer to the object whose lifetime is ending. Its type must be an <b>OpTypePointer</b> with <b>Storage Class Function</b> .  <i>Size</i> is an unsigned 32-bit integer. <i>Size</i> must be 0 if <i>Pointer</i> is a pointer to a non-void type or the <b>Addresses capability</b> is not being used. If <i>Size</i> is non-zero, it is the number of bytes of memory whose lifetime is ending.			<b>Capability:</b> <b>Kernel</b>
3	257	<i>&lt;id&gt;</i> <i>Pointer</i>	<b>Literal</b> <i>Size</i>

## 3.32.18 Atomic Instructions

**OpAtomicLoad**

Atomically load through *Pointer* using the given *Semantics*. All subparts of the value that is loaded will be read atomically with respect to all other atomic accesses to it within *Scope*.

*Result Type* must be a scalar of [integer type](#) or [floating-point type](#).

*Pointer* is the pointer to the memory to read. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

6	227	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt;</a> <i>Semantics</i>
---	-----	----------------------------	-----------------------------------	------------------------	---	---

**OpAtomicStore**

Atomically store through *Pointer* using the given *Semantics*. All subparts of *Value* will be written atomically with respect to all other atomic accesses to it within *Scope*.

*Pointer* is the pointer to the memory to write. The type it points to must be a scalar of [integer type](#) or [floating-point type](#).

*Value* is the value to write. The type of *Value* and the type pointed to by *Pointer* must be the same type.

*Memory* must be a valid memory [Scope](#).

5	228	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt;</a> <i>Semantics</i>	<id> <i>Value</i>
---	-----	------------------------	---	---	----------------------

**OpAtomicExchange**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* from copying *Value*, and
- 3) store the *New Value* back through *Pointer*.

The instruction's result is the *Original Value*.

*Result Type* must be a scalar of [integer type](#) or [floating-point type](#).

The type of *Value* must be the same as *Result Type*. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

7	229	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt;</a> <i>Semantics</i>	<id> <i>Value</i>
---	-----	----------------------------	-----------------------------------	------------------------	---	---	----------------------

**OpAtomicCompareExchange**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* from *Value* only if *Original Value* equals *Comparator*, and
- 3) store the *New Value* back through *Pointer* only if *Original Value* equaled *Comparator*.

The instruction's result is the *Original Value*.

*Result Type* must be an [integer type](#) scalar.

Use *Equal* for the memory semantics of this instruction when *Value* and *Original Value* compare equal.

Use *Unequal* for the memory semantics of this instruction when *Value* and *Original Value* compare unequal. *Unequal* cannot be set to **Release** or **Acquire and Release**. In addition, *Unequal* cannot be set to a stronger memory-order than *Equal*.

The type of *Value* must be the same as *Result Type*. The type of the value pointed to by *Pointer* must be the same as *Result Type*. This type must also match the type of *Comparator*.

*Memory* must be a valid memory [Scope](#).

9	230	<id> <i>Result Type</i>	<a href="#">Result</a> <id>	<id> <i>Pointer</i>	<a href="#">Scope</a> <id> <i>Memory</i>	<a href="#">Memory Semantics</a> <id> <i>Equal</i>	<a href="#">Memory Semantics</a> <id> <i>Unequal</i>	<id> <i>Value</i>	<id> <i>Comparator</i>
---	-----	--------------------------------	--------------------------------	------------------------	--	--	--	----------------------	---------------------------

**OpAtomicCompareExchangeWeak**

[Deprecated](#) (use [OpAtomicCompareExchange](#)).

Has the same semantics as [OpAtomicCompareExchange](#).

*Memory* must be a valid memory [Scope](#).

[Capability:](#)  
**Kernel**

[Missing after version 1.3.](#)

9	231	<id> <i>Result Type</i>	<a href="#">Result</a> <id>	<id> <i>Pointer</i>	<a href="#">Scope</a> <id> <i>Memory</i>	<a href="#">Memory Semantics</a> <id> <i>Equal</i>	<a href="#">Memory Semantics</a> <id> <i>Unequal</i>	<id> <i>Value</i>	<id> <i>Comparator</i>
---	-----	--------------------------------	--------------------------------	------------------------	--	--	--	----------------------	---------------------------

**OpAtomicIncrement**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* through integer addition of 1 to *Original Value*, and
- 3) store the *New Value* back through *Pointer*.

The instruction's result is the *Original Value*.

*Result Type* must be an [integer type](#) scalar. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

6	232	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt;</a> <i>Semantics</i>
---	-----	----------------------------	-----------------------------------	------------------------	---	---

**OpAtomicDecrement**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* through integer subtraction of 1 from *Original Value*, and
- 3) store the *New Value* back through *Pointer*.

The instruction's result is the *Original Value*.

*Result Type* must be an [integer type](#) scalar. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

6	233	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt;</a> <i>Semantics</i>
---	-----	----------------------------	-----------------------------------	------------------------	---	---

**OpAtomicIAdd**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* by integer addition of *Original Value* and *Value*, and
- 3) store the *New Value* back through *Pointer*.

The instruction's result is the *Original Value*.

*Result Type* must be an [integer type](#) scalar.

The type of *Value* must be the same as *Result Type*. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

7	234	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics</a> <id> <i>Semantics</i>	<id> <i>Value</i>
---	-----	----------------------------	-----------------------------------	------------------------	---	--	----------------------

**OpAtomicISub**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* by integer subtraction of *Value* from *Original Value*, and
- 3) store the *New Value* back through *Pointer*.

The instruction's result is the *Original Value*.

*Result Type* must be an [integer type](#) scalar.

The type of *Value* must be the same as *Result Type*. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

7	235	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics</a> <id> <i>Semantics</i>	<id> <i>Value</i>
---	-----	----------------------------	-----------------------------------	------------------------	---	--	----------------------

**OpAtomicSMin**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* by finding the smallest signed integer of *Original Value* and *Value*, and
- 3) store the *New Value* back through *Pointer*.

The instruction's result is the *Original Value*.

*Result Type* must be an [integer type](#) scalar.

The type of *Value* must be the same as *Result Type*. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

7	236	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt; Semantics</a>	<id> <i>Value</i>
---	-----	----------------------------	-----------------------------------	------------------------	---	---	----------------------

**OpAtomicUMin**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* by finding the smallest unsigned integer of *Original Value* and *Value*, and
- 3) store the *New Value* back through *Pointer*.

The instruction's result is the *Original Value*.

*Result Type* must be an [integer type](#) scalar.

The type of *Value* must be the same as *Result Type*. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

7	237	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt; Semantics</a>	<id> <i>Value</i>
---	-----	----------------------------	-----------------------------------	------------------------	---	---	----------------------

**OpAtomicSMax**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* by finding the largest signed integer of *Original Value* and *Value*, and
- 3) store the *New Value* back through *Pointer*.

The instruction's result is the *Original Value*.

*Result Type* must be an [integer type](#) scalar.

The type of *Value* must be the same as *Result Type*. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

7	238	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt; Semantics</a>	<id> <i>Value</i>
---	-----	----------------------------	-----------------------------------	------------------------	---	---	----------------------

**OpAtomicUMax**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* by finding the largest unsigned integer of *Original Value* and *Value*, and
- 3) store the *New Value* back through *Pointer*.

The instruction's result is the *Original Value*.

*Result Type* must be an [integer type](#) scalar.

The type of *Value* must be the same as *Result Type*. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

7	239	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt; Semantics</a>	<id> <i>Value</i>
---	-----	----------------------------	-----------------------------------	------------------------	---	---	----------------------

**OpAtomicAnd**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* by the bitwise AND of *Original Value* and *Value*, and
- 3) store the *New Value* back through *Pointer*.

The instruction's result is the *Original Value*.

*Result Type* must be an [integer type](#) scalar.

The type of *Value* must be the same as *Result Type*. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

7	240	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics</a> <id> <i>Semantics</i>	<id> <i>Value</i>
---	-----	----------------------------	-----------------------------------	------------------------	---	--	----------------------

**OpAtomicOr**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* by the bitwise OR of *Original Value* and *Value*, and
- 3) store the *New Value* back through *Pointer*.

The instruction's result is the *Original Value*.

*Result Type* must be an [integer type](#) scalar.

The type of *Value* must be the same as *Result Type*. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

7	241	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics</a> <id> <i>Semantics</i>	<id> <i>Value</i>
---	-----	----------------------------	-----------------------------------	------------------------	---	--	----------------------

**OpAtomicXor**

Perform the following steps atomically with respect to any other atomic accesses within *Scope* to the same location:

- 1) load through *Pointer* to get an *Original Value*,
- 2) get a *New Value* by the bitwise exclusive OR of *Original Value* and *Value*, and
- 3) store the *New Value* back through *Pointer*.

The instruction's result is the *Original Value*.

*Result Type* must be an [integer type](#) scalar.

The type of *Value* must be the same as *Result Type*. The type of the value pointed to by *Pointer* must be the same as *Result Type*.

*Memory* must be a valid memory [Scope](#).

7	242	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<i>&lt;id&gt;</i> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt; Semantics</a>	<i>&lt;id&gt;</i> <i>Value</i>
---	-----	---	-----------------------------------	-------------------------------------	---	---	-----------------------------------

<b>OpAtomicFlagTestAndSet</b>  Atomically sets the flag value pointed to by <i>Pointer</i> to the set state.  <i>Pointer</i> must be a pointer to a 32-bit integer type representing an atomic flag.  The instruction's result is true if the flag was in the set state or false if the flag was in the clear state immediately before the operation.  <i>Result Type</i> must be a <a href="#">Boolean type</a> .  Results are undefined if an atomic flag is modified by an instruction other than <a href="#">OpAtomicFlagTestAndSet</a> or <a href="#">OpAtomicFlagClear</a>  <i>Memory</i> must be a valid memory <a href="#">Scope</a> .					<a href="#">Capability:</a> <b>Kernel</b>	
6	318	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<i>&lt;id&gt;</i> <i>Pointer</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt;</a> <i>Semantics</i>

<b>OpAtomicFlagClear</b>  Atomically sets the flag value pointed to by <i>Pointer</i> to the clear state.  <i>Pointer</i> must be a pointer to a 32-bit integer type representing an atomic flag.  Memory Semantics cannot be <a href="#">Acquire</a> or <a href="#">AcquireRelease</a>  Results are undefined if an atomic flag is modified by an instruction other than <a href="#">OpAtomicFlagTestAndSet</a> or <a href="#">OpAtomicFlagClear</a>  <i>Memory</i> must be a valid memory <a href="#">Scope</a> .					<a href="#">Capability:</a> <b>Kernel</b>	
4	319	<i>&lt;id&gt;</i> <i>Pointer</i>		<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt;</a> <i>Semantics</i>	

## 3.32.19 Primitive Instructions

<b>OpEmitVertex</b>  Emits the current values of all output variables to the current output primitive. After execution, the values of all output variables are undefined.  This instruction can only be used when only one stream is present.		<b>Capability:</b> <b>Geometry</b>
1		218

<b>OpEndPrimitive</b>  Finish the current primitive and start a new one. No vertex is emitted.  This instruction can only be used when only one stream is present.		<b>Capability:</b> <b>Geometry</b>
1		219

<b>OpEmitStreamVertex</b>  Emits the current values of all output variables to the current output primitive. After execution, the values of all output variables are undefined.  <i>Stream</i> must be an <i>&lt;id&gt;</i> of a <b>constant instruction</b> with a scalar integer type. That constant is the output-primitive stream number.  This instruction can only be used when multiple streams are present.		<b>Capability:</b> <b>GeometryStreams</b>
2	220	<i>&lt;id&gt;</i> <i>Stream</i>

<b>OpEndStreamPrimitive</b>  Finish the current primitive and start a new one. No vertex is emitted.  <i>Stream</i> must be an <i>&lt;id&gt;</i> of a <b>constant instruction</b> with a scalar integer type. That constant is the output-primitive stream number.  This instruction can only be used when multiple streams are present.		<b>Capability:</b> <b>GeometryStreams</b>
2	221	<i>&lt;id&gt;</i> <i>Stream</i>

## 3.32.20 Barrier Instructions

**OpControlBarrier**

Wait for other invocations of this module to reach the current point of execution.

All [invocations](#) of this module within *Execution* scope must reach this point of execution before any invocation will proceed beyond it.

When *Execution* is **Workgroup** or larger, behavior is undefined if this instruction is used in control flow that is [non-uniform](#) within *Execution*. When *Execution* is **Subgroup** or **Invocation**, the behavior of this instruction in non-uniform control flow is defined by the client API.

If *Semantics* is not **None**, this instruction also serves as an [OpMemoryBarrier](#) instruction, and must also perform and adhere to the description and semantics of an **OpMemoryBarrier** instruction with the same *Memory* and *Semantics* operands. This allows atomically specifying both a control barrier and a memory barrier (that is, without needing two instructions). If *Semantics* is **None**, *Memory* is ignored.

Before **version 1.3**, it is only valid to use this instruction with **TessellationControl**, **GLCompute**, or **Kernel execution models**. There is no such restriction starting with **version 1.3**.

When used with the **TessellationControl execution model**, it also implicitly synchronizes the **Output Storage Class**: Writes to **Output** variables performed by any invocation executed prior to a **OpControlBarrier** will be visible to any other invocation after return from that **OpControlBarrier**.

4	224	<a href="#">Scope &lt;id&gt;</a> <i>Execution</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt;</a> <i>Semantics</i>
---	-----	--	---	---

**OpMemoryBarrier**

Control the order that memory accesses are observed.

Ensures that memory accesses issued before this instruction will be observed before memory accesses issued after this instruction. This control is ensured only for memory accesses issued by this [invocation](#) and observed by another invocation executing within *Memory* scope. If the **Vulkan memory model** is declared, this ordering only applies to memory accesses that use the **NonPrivatePointer memory operand** or **NonPrivateTexel image operand**.

*Semantics* declares what kind of memory is being controlled and what kind of control to apply.

To execute both a memory barrier and a control barrier, see [OpControlBarrier](#).

3	225	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt;</a> <i>Semantics</i>
---	-----	---	---

**OpNamedBarrierInitialize**

Declare a new named-barrier object.

*Result Type* must be the type [OpTypeNamedBarrier](#).

*Subgroup Count* must be a 32-bit [integer type](#) scalar representing the number of subgroups that must reach the current point of execution.

**Capability:**  
**NamedBarrier**

[Missing before version 1.1.](#)

4	328	<id> <i>Result Type</i>	Result <id>	<id> <i>Subgroup Count</i>
---	-----	----------------------------	-------------	-------------------------------

<b>OpMemoryNamedBarrier</b>  Wait for other invocations of this module to reach the current point of execution.  <i>Named Barrier</i> must be the type <a href="#">OpTypeNamedBarrier</a> .  If <i>Semantics</i> is not <b>None</b> , this instruction also serves as an <a href="#">OpMemoryBarrier</a> instruction, and must also perform and adhere to the description and semantics of an <b>OpMemoryBarrier</b> instruction with the same <i>Memory</i> and <i>Semantics</i> operands. This allows atomically specifying both a control barrier and a memory barrier (that is, without needing two instructions). If <i>Semantics</i> <b>None</b> , <i>Memory</i> is ignored.		<a href="#">Capability:</a> <b>NamedBarrier</b>  <a href="#">Missing before version 1.1.</a>		
4	329	<id> <i>Named Barrier</i>	<a href="#">Scope &lt;id&gt;</a> <i>Memory</i>	<a href="#">Memory Semantics &lt;id&gt;</a> <i>Semantics</i>

## 3.32.21 Group and Subgroup Instructions

<b>OpGroupAsyncCopy</b>  Perform an asynchronous group copy of <i>Num Elements</i> elements from <i>Source</i> to <i>Destination</i> . The asynchronous copy is performed by all work-items in a group.  This instruction returns an event object that can be used by <a href="#">OpGroupWaitEvents</a> to wait for the async copy to finish.  All <a href="#">invocations</a> of this module within <i>Execution</i> must reach this point of execution.  Behavior is undefined if this instruction is used in control flow that is <a href="#">non-uniform</a> within <i>Execution</i> .  <i>Result Type</i> must be an <a href="#">OpTypeEvent</a> object.  <i>Destination</i> must be a pointer to a scalar or vector of <a href="#">floating-point type</a> or <a href="#">integer type</a> .  <i>Destination</i> pointer <a href="#">Storage Class</a> must be <b>Workgroup</b> or <b>CrossWorkgroup</b> .  The type of <i>Source</i> must be the same as <i>Destination</i> .  When <i>Destination</i> pointer <a href="#">Storage Class</a> is <b>Workgroup</b> , the <i>Source</i> pointer <a href="#">Storage Class</a> must be <b>CrossWorkgroup</b> . In this case <i>Stride</i> defines the stride in elements when reading from <i>Source</i> pointer.  When <i>Destination</i> pointer <a href="#">Storage Class</a> is <b>CrossWorkgroup</b> , the <i>Source</i> pointer <a href="#">Storage Class</a> must be <b>Workgroup</b> . In this case <i>Stride</i> defines the stride in elements when writing each element to <i>Destination</i> pointer.  <i>Stride</i> and <i>NumElements</i> must be a 32-bit <a href="#">integer type</a> scalar when the <a href="#">addressing model</a> is <i>Physical32</i> and 64 bit <a href="#">integer type</a> scalar when the <i>Addressing Model</i> is <i>Physical64</i> .  <i>Event</i> must have a type of <a href="#">OpTypeEvent</a> .  <i>Event</i> can be used to associate the copy with a previous copy allowing an event to be shared by multiple copies. Otherwise <i>Event</i> should be an <a href="#">OpConstantNull</a> .  If <i>Event</i> argument is not <a href="#">OpConstantNull</a> , the event object supplied in event argument will be returned.						<a href="#">Capability:</a> <b>Kernel</b>			
9	259	<id> <i>Result Type</i>	<a href="#">Result</a> <id>	<a href="#">Scope</a> <id> <i>Execution</i>	<id> <i>Destination</i>	<id> <i>Source</i>	<id> <i>Num Elements</i>	<id> <i>Stride</i>	<id> <i>Event</i>

<b>OpGroupWaitEvents</b>  Wait for events generated by <b>OpGroupAsyncCopy</b> operations to complete. <i>Events List</i> points to <i>Num Events</i> event objects, which will be released after the wait is performed.  All <b>invocations</b> of this module within <i>Execution</i> must reach this point of execution.  Behavior is undefined if this instruction is used in control flow that is <b>non-uniform</b> within <i>Execution</i> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  <i>Num Events</i> must be a 32-bit <b>integer type</b> scalar.  <i>Events List</i> must be a pointer to <b>OpTypeEvent</b> .			<b>Capability:</b> <b>Kernel</b>	
4	260	<b>Scope</b> <b>&lt;id&gt;</b> <i>Execution</i>	<b>&lt;id&gt;</b> <i>Num Events</i>	<b>&lt;id&gt;</b> <i>Events List</i>

<b>OpGroupAll</b>  Evaluates a predicate for all invocations in the group,resulting in <b>true</b> if predicate evaluates to <b>true</b> for all <b>invocations</b> in the group, otherwise the result is <b>false</b> .  All <b>invocations</b> of this module within <i>Execution</i> must reach this point of execution.  Behavior is undefined if this instruction is used in control flow that is <b>non-uniform</b> within <i>Execution</i> .  <i>Result Type</i> must be a <b>Boolean type</b> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  <i>Predicate</i> must be a <b>Boolean type</b> .				<b>Capability:</b> <b>Groups</b>	
5	261	<id> <i>Result Type</i>	Result <id>	Scope <id> <i>Execution</i>	<id> <i>Predicate</i>

<b>OpGroupAny</b>  Evaluates a predicate for all invocations in the group, resulting in <b>true</b> if predicate evaluates to <b>true</b> for any <b>invocation</b> in the group, otherwise the result is <b>false</b> .  All <b>invocations</b> of this module within <i>Execution</i> must reach this point of execution.  Behavior is undefined if this instruction is used in control flow that is <b>non-uniform</b> within <i>Execution</i> .  <i>Result Type</i> must be a <b>Boolean type</b> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  <i>Predicate</i> must be a <b>Boolean type</b> .				<b>Capability:</b> <b>Groups</b>	
5	262	<id> <i>Result Type</i>	Result <id>	Scope <id> <i>Execution</i>	<id> <i>Predicate</i>

<b>OpGroupBroadcast</b>				<b>Capability:</b> <b>Groups</b>		
Return the <i>Value</i> of the <b>invocation</b> identified by the local id <i>LocalId</i> to all invocations in the group.						
All <b>invocations</b> of this module within <i>Execution</i> must reach this point of execution.						
Behavior is undefined if this instruction is used in control flow that is <b>non-uniform</b> within <i>Execution</i> .						
<i>Result Type</i> must be a scalar or vector of <b>floating-point type</b> , <b>integer type</b> , or <b>Boolean type</b> .						
<i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .						
The type of <i>Value</i> must be the same as <i>Result Type</i> .						
<i>LocalId</i> must be an integer datatype. It can be a scalar, or a vector with 2 components or a vector with 3 components. <i>LocalId</i> must be the same for all <b>invocations</b> in the group.						
6	263	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<b>Scope &lt;id&gt;</b> <i>Execution</i>	<id> <i>Value</i>	<id> <i>LocalId</i>

<b>OpGroupIAdd</b>  An integer add group operation specified for all values of $X$ specified by <b>invocations</b> in the group.  All <b>invocations</b> of this module within <i>Execution</i> must reach this point of execution.  Behavior is undefined if this instruction is used in control flow that is <b>non-uniform</b> within <i>Execution</i> .  <i>Result Type</i> must be a scalar or vector of <b>integer type</b> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity $I$ for <i>Operation</i> is 0.  The type of $X$ must be the same as <i>Result Type</i> .					<b>Capability:</b> <b>Groups</b>	
6	264	<id> <i>Result Type</i>	Result <id>	Scope <id> <i>Execution</i>	Group Operation <i>Operation</i>	<id> $X$

<b>OpGroupFAdd</b>  A floating-point add group operation specified for all values of $X$ specified by <b>invocations</b> in the group.  All <b>invocations</b> of this module within <i>Execution</i> must reach this point of execution.  Behavior is undefined if this instruction is used in control flow that is <b>non-uniform</b> within <i>Execution</i> .  <i>Result Type</i> must be a scalar or vector of <b>floating-point type</b> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity $I$ for <i>Operation</i> is 0.  The type of $X$ must be the same as <i>Result Type</i> .					<b>Capability:</b> <b>Groups</b>	
6	265	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<b>Scope &lt;id&gt;</b> <i>Execution</i>	<b>Group Operation</b> <i>Operation</i>	<id> $X$

<b>OpGroupFMin</b>  A floating-point minimum group operation specified for all values of $X$ specified by <a href="#">invocations</a> in the group.  All <a href="#">invocations</a> of this module within <i>Execution</i> must reach this point of execution.  Behavior is undefined if this instruction is used in control flow that is <a href="#">non-uniform</a> within <i>Execution</i> .  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity $I$ for <i>Operation</i> is +INF.  The type of $X$ must be the same as <i>Result Type</i> .					<a href="#">Capability:</a> <b>Groups</b>	
6	266	<a href="#">&lt;id&gt;</a> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Scope &lt;id&gt;</a> <i>Execution</i>	<a href="#">Group Operation</a> <i>Operation</i>	<a href="#">&lt;id&gt;</a> $X$

<b>OpGroupUMin</b>  An unsigned integer minimum group operation specified for all values of $X$ specified by <a href="#">invocations</a> in the group.  All <a href="#">invocations</a> of this module within <i>Execution</i> must reach this point of execution.  Behavior is undefined if this instruction is used in control flow that is <a href="#">non-uniform</a> within <i>Execution</i> .  <i>Result Type</i> must be a scalar or vector of <a href="#">integer type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity $I$ for <i>Operation</i> is UINT_MAX when $X$ is 32 bits wide and ULONG_MAX when $X$ is 64 bits wide.  The type of $X$ must be the same as <i>Result Type</i> .					<a href="#">Capability:</a> <b>Groups</b>	
6	267	<a href="#">&lt;id&gt;</a> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Scope &lt;id&gt;</a> <i>Execution</i>	<a href="#">Group Operation</a> <i>Operation</i>	<a href="#">&lt;id&gt;</a> $X$

<b>OpGroupSMin</b>  A signed integer minimum group operation specified for all values of $X$ specified by <a href="#">invocations</a> in the group.  All <a href="#">invocations</a> of this module within <i>Execution</i> must reach this point of execution.  Behavior is undefined if this instruction is used in control flow that is <a href="#">non-uniform</a> within <i>Execution</i> .  <i>Result Type</i> must be a scalar or vector of <a href="#">integer type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity $I$ for <i>Operation</i> is INT_MAX when $X$ is 32 bits wide and LONG_MAX when $X$ is 64 bits wide.  The type of $X$ must be the same as <i>Result Type</i> .					<a href="#">Capability:</a> <b>Groups</b>	
6	268	<a href="#">&lt;id&gt;</a> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Scope &lt;id&gt;</a> <i>Execution</i>	<a href="#">Group Operation</a> <i>Operation</i>	<a href="#">&lt;id&gt;</a> $X$

<b>OpGroupFMax</b>  A floating-point maximum group operation specified for all values of $X$ specified by <a href="#">invocations</a> in the group.  All <a href="#">invocations</a> of this module within <i>Execution</i> must reach this point of execution.  Behavior is undefined if this instruction is used in control flow that is <a href="#">non-uniform</a> within <i>Execution</i> .  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity $I$ for <i>Operation</i> is -INF.  The type of $X$ must be the same as <i>Result Type</i> .					<a href="#">Capability:</a> <b>Groups</b>	
6	269	<a href="#">&lt;id&gt;</a> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Scope &lt;id&gt;</a> <i>Execution</i>	<a href="#">Group Operation</a> <i>Operation</i>	<a href="#">&lt;id&gt;</a> $X$

<b>OpGroupUMax</b>  An unsigned integer maximum group operation specified for all values of <i>X</i> specified by <a href="#">invocations</a> in the group.  All <a href="#">invocations</a> of this module within <i>Execution</i> must reach this point of execution.  Behavior is undefined if this instruction is used in control flow that is <a href="#">non-uniform</a> within <i>Execution</i> .  <i>Result Type</i> must be a scalar or vector of <a href="#">integer type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity <i>I</i> for <i>Operation</i> is 0.  The type of <i>X</i> must be the same as <i>Result Type</i> .					<a href="#">Capability:</a> <b>Groups</b>	
6	270	<i>&lt;id&gt;</i> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Scope &lt;id&gt;</a> <i>Execution</i>	<a href="#">Group Operation</a> <i>Operation</i>	<i>&lt;id&gt;</i> <i>X</i>

<b>OpGroupSMax</b>  A signed integer maximum group operation specified for all values of <i>X</i> specified by <a href="#">invocations</a> in the group.  All <a href="#">invocations</a> of this module within <i>Execution</i> must reach this point of execution.  Behavior is undefined if this instruction is used in control flow that is <a href="#">non-uniform</a> within <i>Execution</i> .  <i>Result Type</i> must be a scalar or vector of <a href="#">integer type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity <i>I</i> for <i>Operation</i> is INT_MIN when <i>X</i> is 32 bits wide and LONG_MIN when <i>X</i> is 64 bits wide.  The type of <i>X</i> must be the same as <i>Result Type</i> .					<a href="#">Capability:</a> <b>Groups</b>

3.32.22 Device-Side Enqueue Instructions

<div><b>OpEnqueueMarker</b></div> <div>Enqueue a marker command to the queue object specified by <i>Queue</i>. The marker command waits for a list of events to complete, or if the list is empty it waits for all previously enqueued commands in <i>Queue</i> to complete before the marker completes.</div> <div><i>Result Type</i> must be a 32-bit integer type scalar. A successful enqueue results in the value 0. A failed enqueue results in a non-0 value.</div> <div><i>Queue</i> must be of the type OpTypeQueue.</div> <div><i>Num Events</i> specifies the number of event objects in the wait list pointed to by <i>Wait Events</i> and must be a 32-bit integer type scalar, which is treated as an unsigned integer.</div> <div><i>Wait Events</i> specifies the list of wait event objects and must be a pointer to OpTypeDeviceEvent.</div> <div><i>Ret Event</i> is a pointer to a device event which gets implicitly retained by this instruction. It must have a type of OpTypePointer to OpTypeDeviceEvent. If <i>Ret Event</i> is set to null this instruction becomes a no-op.</div>					<div>Capability:</div> <div>DeviceEnqueue</div>		
7	291	<id> Result Type	Result <id>	<id> Queue	<id> Num Events	<id> Wait Events	<id> Ret Event

<b>OpEnqueueKernel</b>  Enqueue the function specified by <i>Invoke</i> and the NDRange specified by <i>ND Range</i> for execution to the queue object specified by <i>Queue</i> .  <i>Result Type</i> must be a 32-bit <a href="#">integer type</a> scalar. A successful enqueue results in the value 0. A failed enqueue results in a non-0 value.  <i>Queue</i> must be of the type <a href="#">OpTypeQueue</a> .  <i>Flags</i> must be an <a href="#">integer type</a> scalar. The content of <i>Flags</i> is interpreted as <a href="#">Kernel Enqueue Flags</a> mask.  The type of <i>ND Range</i> must be an <a href="#">OpTypeStruct</a> whose members are as described by the <i>Result Type</i> of <a href="#">OpBuildNDRange</a> .  <i>Num Events</i> specifies the number of event objects in the wait list pointed to by <i>Wait Events</i> and must be 32-bit <a href="#">integer type</a> scalar, which is treated as an unsigned integer.  <i>Wait Events</i> specifies the list of wait event objects and must be a pointer to <a href="#">OpTypeDeviceEvent</a> .  <i>Ret Event</i> must be a pointer to <a href="#">OpTypeDeviceEvent</a> which gets implicitly retained by this instruction.  <i>Invoke</i> must be an <a href="#">OpFunction</a> whose <a href="#">OpTypeFunction</a> operand has: <ul style="list-style-type: none"> <li>- <i>Result Type</i> must be <a href="#">OpTypeVoid</a>.</li> <li>- The first parameter must have a type of <a href="#">OpTypePointer</a> to an 8-bit <a href="#">OpTypeInt</a>.</li> <li>- An optional list of parameters, each of which must have a type of <a href="#">OpTypePointer</a> to the <b>Workgroup Storage Class</b>.</li> </ul> <i>Param</i> is the first parameter of the function specified by <i>Invoke</i> and must be a pointer to an 8-bit <a href="#">integer type</a> scalar.  <i>Param Size</i> is the size in bytes of the memory pointed to by <i>Param</i> and must be a 32-bit <a href="#">integer type</a> scalar, which is treated as an unsigned integer.  <i>Param Align</i> is the alignment of <i>Param</i> and must be a 32-bit <a href="#">integer type</a> scalar, which is treated as an unsigned integer.  Each <i>Local Size</i> operand corresponds (in order) to one <a href="#">OpTypePointer</a> to <b>Workgroup Storage Class</b> parameter to the <i>Invoke</i> function, and specifies the number of bytes of <b>Workgroup</b> storage used to back the pointer during the execution of the <i>Invoke</i> function.										<b>Capability:</b> <b>DeviceEnqueue</b>				
13 + vari- able	292	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Queue</i>	<id> <i>Flags</i>	<id> <i>ND Range</i>	<id> <i>Num Events</i>	<id> <i>Wait Events</i>	<id> <i>Ret Event</i>	<id> <i>Invoke</i>	<id> <i>Param</i>	<id> <i>Param Size</i>	<id> <i>Param Align</i>	<id>, ... <i>Local Size</i>

<b>OpGetKernelNDRangeSubGroupCount</b>  Returns the number of subgroups in each workgroup of the dispatch (except for the last in cases where the global size does not divide cleanly into work-groups) given the combination of the passed NDRange descriptor specified by <i>ND Range</i> and the function specified by <i>Invoke</i> .  <i>Result Type</i> must be a 32-bit integer type scalar.  The type of <i>ND Range</i> must be an <b>OpTypeStruct</b> whose members are as described by the <i>Result Type</i> of <b>OpBuildNDRange</b> .  <i>Invoke</i> must be an <b>OpFunction</b> whose <b>OpTypeFunction</b> operand has: - <i>Result Type</i> must be <b>OpTypeVoid</b> . - The first parameter must have a type of <b>OpTypePointer</b> to an 8-bit <b>OpTypeInt</b> . - An optional list of parameters, each of which must have a type of <b>OpTypePointer</b> to the <b>Workgroup Storage Class</b> .  <i>Param</i> is the first parameter of the function specified by <i>Invoke</i> and must be a pointer to an 8-bit integer type scalar.  <i>Param Size</i> is the size in bytes of the memory pointed to by <i>Param</i> and must be a 32-bit integer type scalar, which is treated as an unsigned integer.  <i>Param Align</i> is the alignment of <i>Param</i> and must be a 32-bit integer type scalar, which is treated as an unsigned integer.						<b>Capability:</b> <b>DeviceEnqueue</b>		
8	293	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<id> <i>ND Range</i>	<id> <i>Invoke</i>	<id> <i>Param</i>	<id> <i>Param Size</i>	<id> <i>Param Align</i>

<b>OpGetKernelNDRangeMaxSubGroupSize</b>  Returns the maximum sub-group size for the function specified by <i>Invoke</i> and the NDRange specified by <i>ND Range</i> .  <i>Result Type</i> must be a 32-bit integer type scalar.  The type of <i>ND Range</i> must be an <b>OpTypeStruct</b> whose members are as described by the <i>Result Type</i> of <b>OpBuildNDRange</b> .  <i>Invoke</i> must be an <b>OpFunction</b> whose <b>OpTypeFunction</b> operand has: - <i>Result Type</i> must be <b>OpTypeVoid</b> . - The first parameter must have a type of <b>OpTypePointer</b> to an 8-bit <b>OpTypeInt</b> . - An optional list of parameters, each of which must have a type of <b>OpTypePointer</b> to the <b>Workgroup Storage Class</b> .  <i>Param</i> is the first parameter of the function specified by <i>Invoke</i> and must be a pointer to an 8-bit integer type scalar.  <i>Param Size</i> is the size in bytes of the memory pointed to by <i>Param</i> and must be a 32-bit integer type scalar, which is treated as an unsigned integer.  <i>Param Align</i> is the alignment of <i>Param</i> and must be a 32-bit integer type scalar, which is treated as an unsigned integer.					<b>Capability:</b> <b>DeviceEnqueue</b>			
8	294	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<id> <i>ND Range</i>	<id> <i>Invoke</i>	<id> <i>Param</i>	<id> <i>Param Size</i>	<id> <i>Param Align</i>

<b>OpGetKernelWorkGroupSize</b>  Returns the maximum work-group size that can be used to execute the function specified by <i>Invoke</i> on the device.  <i>Result Type</i> must be a 32-bit integer type scalar.  <i>Invoke</i> must be an <b>OpFunction</b> whose <b>OpTypeFunction</b> operand has: - <i>Result Type</i> must be <b>OpTypeVoid</b> . - The first parameter must have a type of <b>OpTypePointer</b> to an 8-bit <b>OpTypeInt</b> . - An optional list of parameters, each of which must have a type of <b>OpTypePointer</b> to the <b>Workgroup Storage Class</b> .  <i>Param</i> is the first parameter of the function specified by <i>Invoke</i> and must be a pointer to an 8-bit integer type scalar.  <i>Param Size</i> is the size in bytes of the memory pointed to by <i>Param</i> and must be a 32-bit integer type scalar, which is treated as an unsigned integer.  <i>Param Align</i> is the alignment of <i>Param</i> and must be a 32-bit integer type scalar, which is treated as an unsigned integer.					<b>Capability:</b> <b>DeviceEnqueue</b>		
7	295	<id> <i>Result Type</i>	Result <id>	<id> <i>Invoke</i>	<id> <i>Param</i>	<id> <i>Param Size</i>	<id> <i>Param Align</i>

<b>OpGetKernelPreferredWorkGroupSizeMultiple</b>  Returns the preferred multiple of work-group size for the function specified by <i>Invoke</i> . This is a performance hint. Specifying a work-group size that is not a multiple of the value returned by this query as the value of the local work size will not fail to enqueue <i>Invoke</i> for execution unless the work-group size specified is larger than the device maximum.  <i>Result Type</i> must be a 32-bit integer type scalar.  <i>Invoke</i> must be an OpFunction whose OpTypeFunction operand has: - <i>Result Type</i> must be OpTypeVoid. - The first parameter must have a type of OpTypePointer to an 8-bit OpTypeInt. - An optional list of parameters, each of which must have a type of OpTypePointer to the Workgroup Storage Class.  <i>Param</i> is the first parameter of the function specified by <i>Invoke</i> and must be a pointer to an 8-bit integer type scalar.  <i>Param Size</i> is the size in bytes of the memory pointed to by <i>Param</i> and must be a 32-bit integer type scalar, which is treated as an unsigned integer.  <i>Param Align</i> is the alignment of <i>Param</i> and must be a 32-bit integer type scalar, which is treated as an unsigned integer.					<b>Capability:</b> <b>DeviceEnqueue</b>		
7	296	<id> <i>Result Type</i>	Result <id> <i>Invoke</i>	<id> <i>Param</i>	<id> <i>Param Size</i>	<id> <i>Param Align</i>	

<b>OpRetainEvent</b>  Increments the reference count of the event object specified by <i>Event</i> .  <i>Event</i> must be an event that was produced by <b>OpEnqueueKernel</b> , <b>OpEnqueueMarker</b> or <b>OpCreateUserEvent</b> .		<b>Capability:</b> <b>DeviceEnqueue</b>	
2	297	<id> <i>Event</i>	

<b>OpReleaseEvent</b>  Decrements the reference count of the event object specified by <i>Event</i> . The event object is deleted once the event reference count is zero, the specific command identified by this event has completed (or terminated) and there are no commands in any device command queue that require a wait for this event to complete.  <i>Event</i> must be an event that was produced by <a href="#">OpEnqueueKernel</a> , <a href="#">OpEnqueueMarker</a> or <a href="#">OpCreateUserEvent</a> .			<a href="#">Capability:</a> <b>DeviceEnqueue</b>	
2	298	<id> <i>Event</i>		

<b>OpCreateUserEvent</b>  Create a user event. The execution status of the created event is set to a value of 2 (CL_SUBMITTED).  <i>Result Type</i> must be <a href="#">OpTypeDeviceEvent</a> .			<a href="#">Capability:</a> <b>DeviceEnqueue</b>	
3	299	<id> <i>Result Type</i>	Result <id>	

<b>OpIsValidEvent</b>  Returns <b>true</b> if the event specified by <i>Event</i> is a valid event, otherwise result is <b>false</b> .  <i>Result Type</i> must be a <a href="#">Boolean type</a> .  <i>Event</i> must have a type of <a href="#">OpTypeDeviceEvent</a>			<a href="#">Capability:</a> <b>DeviceEnqueue</b>	
4	300	<id> <i>Result Type</i>	Result <id>	<id> <i>Event</i>

<b>OpSetUserEventStatus</b>  Sets the execution status of a user event specified by <i>Event</i> . <i>Status</i> can be either 0 (CL_COMPLETE) to indicate that this kernel and all its child kernels finished execution successfully, or a negative integer value indicating an error.  <i>Event</i> must have a type of <a href="#">OpTypeDeviceEvent</a> that was produced by <a href="#">OpCreateUserEvent</a> .  <i>Status</i> must have a type of 32-bit <a href="#">OpTypeInt</a> treated as a signed integer.			<a href="#">Capability:</a> <b>DeviceEnqueue</b>	
3	301	<id> <i>Event</i>	<id> <i>Status</i>	

<b>OpCaptureEventProfilingInfo</b>  Captures the profiling information specified by <i>Profiling Info</i> for the command associated with the event specified by <i>Event</i> in the memory pointed to by <i>Value</i> . The profiling information will be available in the memory pointed to by <i>Value</i> once the command identified by <i>Event</i> has completed.  <i>Event</i> must have a type of <b>OpTypeDeviceEvent</b> that was produced by <b>OpEnqueueKernel</b> or <b>OpEnqueueMarker</b> .  <i>Profiling Info</i> must be an <b>integer type</b> scalar. The content of <i>Profiling Info</i> is interpreted as <b>Kernel Profiling Info</b> mask.  <i>Value</i> must be a pointer to a scalar 8-bit <b>integer type</b> in the <b>CrossWorkgroup Storage Class</b> .  When <i>Profiling Info</i> is <b>CmdExecTime</b> , <i>Value</i> must point to 128-bit memory range. The first 64 bits contain the elapsed time CL_PROFILING_COMMAND_END - CL_PROFILING_COMMAND_START for the command identified by <i>Event</i> in nanoseconds. The second 64 bits contain the elapsed time CL_PROFILING_COMMAND_COMPLETE - CL_PROFILING_COMMAND_START for the command identified by <i>Event</i> in nanoseconds.  <b>Note:</b> The behavior of this instruction is undefined when called multiple times for the same event.			<b>Capability:</b> <b>DeviceEnqueue</b>	
4	302	<id> <i>Event</i>	<id> <i>Profiling Info</i>	<id> <i>Value</i>

<b>OpGetDefaultQueue</b>  Returns the default device queue. If a default device queue has not been created, a null queue object is returned.  <i>Result Type</i> must be an <b>OpTypeQueue</b> .			<b>Capability:</b> <b>DeviceEnqueue</b>	
3	303	<id> <i>Result Type</i>	<b>Result</b> <id>	

<b>OpBuildNDRange</b>  Given the global work size specified by <i>GlobalWorkSize</i> , local work size specified by <i>LocalWorkSize</i> and global work offset specified by <i>GlobalWorkOffset</i> , builds a 1D, 2D or 3D ND-range descriptor structure and returns it.  <i>Result Type</i> must be an <b>OpTypeStruct</b> with the following ordered list of members, starting from the first to last:  1) 32-bit <b>integer type</b> scalar, that specifies the number of dimensions used to specify the global work-items and work-items in the work-group.  2) <b>OpTypeArray</b> with 3 elements, where each element is 32-bit <b>integer type</b> scalar when the <b>addressing model</b> is <b>Physical32</b> and 64-bit <b>integer type</b> scalar when the <b>addressing model</b> is <b>Physical64</b> . This member is an array of per-dimension unsigned values that describe the offset used to calculate the global ID of a work-item.  3) <b>OpTypeArray</b> with 3 elements, where each element is 32-bit <b>integer type</b> scalar when the <b>addressing model</b> is <b>Physical32</b> and 64-bit <b>integer type</b> scalar when the <b>addressing model</b> is <b>Physical64</b> . This member is an array of per-dimension unsigned values that describe the number of global work-items in the dimensions that will execute the kernel function.  4) <b>OpTypeArray</b> with 3 elements, where each element is 32-bit <b>integer type</b> scalar when the <b>addressing model</b> is <b>Physical32</b> and 64-bit <b>integer type</b> scalar when the <b>addressing model</b> is <b>Physical64</b> . This member is an array of per-dimension unsigned values that describe the number of work-items that make up a work-group.  <i>GlobalWorkSize</i> must be a scalar or an array with 2 or 3 components. Where the type of each element in the array is 32-bit <b>integer type</b> scalar when the <b>addressing model</b> is <b>Physical32</b> or 64-bit <b>integer type</b> scalar when the <b>addressing model</b> is <b>Physical64</b> .  The type of <i>LocalWorkSize</i> must be the same as <i>GlobalWorkSize</i> .  The type of <i>GlobalWorkOffset</i> must be the same as <i>GlobalWorkSize</i> .				<b>Capability:</b> <b>DeviceEnqueue</b>		
6	304	<id> <i>Result Type</i>	<b>Result</b> <id>	<id> <i>GlobalWorkSize</i>	<id> <i>LocalWorkSize</i>	<id> <i>GlobalWorkOffset</i>

<b>OpGetKernelLocalSizeForSubgroupCount</b>  Returns the 1D local size to enqueue <i>Invoke</i> with <i>Subgroup Count</i> subgroups per workgroup.  <i>Result Type</i> must be a 32-bit <i>integer type</i> scalar.  <i>Subgroup Count</i> must be a 32-bit <i>integer type</i> scalar.  <i>Invoke</i> must be an <i>OpFunction</i> whose <i>OpTypeFunction</i> operand has: <ul style="list-style-type: none"> <li>- <i>Result Type</i> must be <i>OpTypeVoid</i>.</li> <li>- The first parameter must have a type of <i>OpTypePointer</i> to an 8-bit <i>OpTypeInt</i>.</li> <li>- An optional list of parameters, each of which must have a type of <i>OpTypePointer</i> to the <b>Workgroup Storage Class</b>.</li> </ul> <i>Param</i> is the first parameter of the function specified by <i>Invoke</i> and must be a pointer to an 8-bit <i>integer type</i> scalar.  <i>Param Size</i> is the size in bytes of the memory pointed to by <i>Param</i> and must be a 32-bit <i>integer type</i> scalar, which is treated as an unsigned integer.  <i>Param Align</i> is the alignment of <i>Param</i> and must be a 32-bit <i>integer type</i> scalar, which is treated as an unsigned integer.						<b>Capability:</b> <b>SubgroupDispatch</b>  Missing before version 1.1.		
8	325	<id> <i>Result Type</i>	Result <id>	<id> <i>Subgroup Count</i>	<id> <i>Invoke</i>	<id> <i>Param</i>	<id> <i>Param Size</i>	<id> <i>Param Align</i>

<b>OpGetKernelMaxNumSubgroups</b>  Returns the maximum number of subgroups that can be used to execute <i>Invoke</i> on the device.  <i>Result Type</i> must be a 32-bit <i>integer type</i> scalar.  <i>Invoke</i> must be an <i>OpFunction</i> whose <i>OpTypeFunction</i> operand has: <ul style="list-style-type: none"> <li>- <i>Result Type</i> must be <i>OpTypeVoid</i>.</li> <li>- The first parameter must have a type of <i>OpTypePointer</i> to an 8-bit <i>OpTypeInt</i>.</li> <li>- An optional list of parameters, each of which must have a type of <i>OpTypePointer</i> to the <b>Workgroup Storage Class</b>.</li> </ul> <i>Param</i> is the first parameter of the function specified by <i>Invoke</i> and must be a pointer to an 8-bit <i>integer type</i> scalar.  <i>Param Size</i> is the size in bytes of the memory pointed to by <i>Param</i> and must be a 32-bit <i>integer type</i> scalar, which is treated as an unsigned integer.  <i>Param Align</i> is the alignment of <i>Param</i> and must be a 32-bit <i>integer type</i> scalar, which is treated as an unsigned integer.						<b>Capability:</b> <b>SubgroupDispatch</b>  Missing before version 1.1.

3.32.23 Pipe Instructions

<b>OpReadPipe</b>  Read a packet from the pipe object specified by <i>Pipe</i> into <i>Pointer</i> . Result is 0 if the operation is successful and a negative value if the pipe is empty.  <i>Result Type</i> must be a 32-bit integer type scalar.  <i>Pipe</i> must have a type of <b>OpTypePipe</b> with <b>ReadOnly</b> access qualifier.  <i>Pointer</i> must have a type of <b>OpTypePointer</b> with the same data type as <i>Pipe</i> and a <b>Generic Storage Class</b> .  <i>Packet Size</i> must be a 32-bit integer type scalar that represents the size in bytes of each packet in the pipe.  <i>Packet Alignment</i> must be a 32-bit integer type scalar that represents the alignment in bytes of each packet in the pipe.  <i>Packet Size</i> and <i>Packet Alignment</i> must satisfy the following: - $1 \leq \text{Packet Alignment} \leq \text{Packet Size}$ . - <i>Packet Alignment</i> must evenly divide <i>Packet Size</i>  For concrete types, <i>Packet Alignment</i> should equal <i>Packet Size</i> . For aggregate types, <i>Packet Alignment</i> should be the size of the largest primitive type in the hierarchy of types.				<b>Capability:</b> <b>Pipes</b>			
7	274	<id> Result Type	Result <id>	<id> Pipe	<id> Pointer	<id> Packet Size	<id> Packet Alignment

<b>OpWritePipe</b>  Write a packet from <i>Pointer</i> to the pipe object specified by <i>Pipe</i> . Result is 0 if the operation is successful and a negative value if the pipe is full.  <i>Result Type</i> must be a 32-bit integer type scalar.  <i>Pipe</i> must have a type of <b>OpTypePipe</b> with <b>WriteOnly</b> access qualifier.  <i>Pointer</i> must have a type of <b>OpTypePointer</b> with the same data type as <i>Pipe</i> and a <b>Generic Storage Class</b> .  <i>Packet Size</i> must be a 32-bit integer type scalar that represents the size in bytes of each packet in the pipe.  <i>Packet Alignment</i> must be a 32-bit integer type scalar that represents the alignment in bytes of each packet in the pipe.  <i>Packet Size</i> and <i>Packet Alignment</i> must satisfy the following: - $1 \leq \text{Packet Alignment} \leq \text{Packet Size}$ . - <i>Packet Alignment</i> must evenly divide <i>Packet Size</i>  For concrete types, <i>Packet Alignment</i> should equal <i>Packet Size</i> . For aggregate types, <i>Packet Alignment</i> should be the size of the largest primitive type in the hierarchy of types.				Capability: <b>Pipes</b>

<b>OpConstantPipeStorage</b>  Creates a pipe-storage object.  <i>Result Type</i> must be <a href="#">OpTypePipeStorage</a> .  <i>Packet Size</i> is an unsigned 32-bit integer. It represents the size in bytes of each packet in the pipe.  <i>Packet Alignment</i> is an unsigned 32-bit integer. It represents the alignment in bytes of each packet in the pipe.  <i>Packet Size</i> and <i>Packet Alignment</i> must satisfy the following: <ul style="list-style-type: none"> <li>- <math>1 \leq \text{Packet Alignment} \leq \text{Packet Size}</math>.</li> <li>- <i>Packet Alignment</i> must evenly divide <i>Packet Size</i>.</li> </ul> For concrete types, <i>Packet Alignment</i> should equal <i>Packet Size</i> . For aggregate types, <i>Packet Alignment</i> should be the size of the largest primitive type in the hierarchy of types.  <i>Capacity</i> is an unsigned 32-bit integer. It is the minimum number of <i>Packet Size</i> blocks the resulting <a href="#">OpTypePipeStorage</a> can hold.				<b>Capability:</b> <b>PipeStorage</b>  <a href="#">Missing before version 1.1.</a>		
6	323	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Literal</a> <i>Packet Size</i>	<a href="#">Literal</a> <i>Packet Alignment</i>	<a href="#">Literal</a> <i>Capacity</i>

<b>OpCreatePipeFromPipeStorage</b>  Creates a pipe object from a pipe-storage object.  <i>Result Type</i> must be <a href="#">OpTypePipe</a> .  <i>Pipe Storage</i> must be a pipe-storage object created from <a href="#">OpConstantPipeStorage</a> .  <i>Qualifier</i> is the pipe access qualifier.				<b>Capability:</b> <b>PipeStorage</b>  <a href="#">Missing before version 1.1.</a>		
4	324	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<id> <i>Pipe Storage</i>		

## 3.32.24 Non-Uniform Instructions

<b>OpGroupNonUniformElect</b>  Result is <b>true</b> only in the active <a href="#">invocation</a> with the lowest id in the group, otherwise result is false.  <i>Result Type</i> must be a <a href="#">Boolean type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .			Capability: <b>GroupNonUniform</b>  Missing before <b>version 1.3</b> .	
4	333	<id> <i>Result Type</i>	Result <id>	Scope <id> <i>Execution</i>

<b>OpGroupNonUniformAll</b>				<b>Capability:</b> <b>GroupNonUniformVote</b>	
Evaluates a predicate for all active invocations in the group, resulting in <b>true</b> if predicate evaluates to <b>true</b> for all active <b>invocations</b> in the group, otherwise the result is <b>false</b> .				<b>Missing before version 1.3.</b>	
<i>Result Type</i> must be a <b>Boolean type</b> .					
<i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .					
<i>Predicate</i> must be a <b>Boolean type</b> .					
5	334	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<b>Scope &lt;id&gt;</b> <i>Execution</i>	<id> <i>Predicate</i>

<b>OpGroupNonUniformAny</b>				<b>Capability:</b> <b>GroupNonUniformVote</b>	
Evaluates a predicate for all active invocations in the group, resulting in <b>true</b> if predicate evaluates to <b>true</b> for any active <b>invocation</b> in the group, otherwise the result is <b>false</b> .				Missing before <b>version 1.3</b> .	
<i>Result Type</i> must be a <b>Boolean type</b> .					
<i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .					
<i>Predicate</i> must be a <b>Boolean type</b> .					
5	335	<id> <i>Result Type</i>	Result <id>	Scope <id> <i>Execution</i>	<id> <i>Predicate</i>

<b>OpGroupNonUniformAllEqual</b>  Evaluates a value for all active invocations in the group. The result is <b>true</b> if <i>Value</i> is equal for all active invocations in the group. Otherwise, the result is <b>false</b> .  <i>Result Type</i> must be a <b>Boolean type</b> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  <i>Value</i> must be a scalar or vector of <b>floating-point type</b> , <b>integer type</b> , or <b>Boolean type</b> . The compare operation is based on this type, and when it is a floating-point type, an ordered-and-equal compare is used.				<b>Capability:</b> <b>GroupNonUniformVote</b>  Missing before version 1.3.	
5	336	<id> <i>Result Type</i>	Result <id>	Scope <id> <i>Execution</i>	<id> <i>Value</i>

<b>OpGroupNonUniformBroadcast</b>  Return the <i>Value</i> of the <b>invocation</b> identified by the id <i>Id</i> to all active invocations in the group.  <i>Result Type</i> must be a scalar or vector of <b>floating-point type</b> , <b>integer type</b> , or <b>Boolean type</b> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The type of <i>Value</i> must be the same as <i>Result Type</i> .  <i>Id</i> must be a scalar of <b>integer type</b> , whose <i>Signedness</i> operand is 0.  Before <b>version 1.4</b> , <i>Id</i> must come from a <b>constant instruction</b> . Starting with <b>version 1.5</b> , <i>Id</i> must be <b>dynamically uniform</b> .  The resulting value is undefined if <i>Id</i> is an inactive invocation, or is greater than or equal to the size of the group.				<b>Capability:</b> <b>GroupNonUniformBallot</b>  Missing before version 1.3.	
6	337	<id> <i>Result Type</i>	Result <id>	Scope <id> <i>Execution</i>	<id> <i>Value</i>  <id> <i>Id</i>

<b>OpGroupNonUniformBroadcastFirst</b>  Return the <i>Value</i> of the <b>invocation</b> from the active invocation with the lowest id in the group to all active invocations in the group.  <i>Result Type</i> must be a scalar or vector of <b>floating-point type</b> , <b>integer type</b> , or <b>Boolean type</b> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The type of <i>Value</i> must be the same as <i>Result Type</i> .				<b>Capability:</b> <b>GroupNonUniformBallot</b>  Missing before version 1.3.	
--	--	--	--	---	--

5	338	<id> <i>Result Type</i>	Result <id>	Scope <id> <i>Execution</i>	<id> <i>Value</i>
---	-----	----------------------------	-------------	--------------------------------	----------------------

<b>OpGroupNonUniformBallot</b>  Returns a bitfield value combining the <i>Predicate</i> value from all invocations in the group that execute the same dynamic instance of this instruction. The bit is set to one if the corresponding invocation is active and the <i>Predicate</i> for that invocation evaluated to true; otherwise, it is set to zero.  <i>Result Type</i> must be a vector of four components of <a href="#">integer type</a> scalar, whose <i>Signedness</i> operand is 0.  <i>Result</i> is a set of bitfields where the first invocation is represented in the lowest bit of the first vector component and the last (up to the size of the group) is the higher bit number of the last bitmask needed to represent all bits of the group invocations.  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup</b> <a href="#">Scope</a> .  <i>Predicate</i> must be a <a href="#">Boolean type</a> .			<a href="#">Capability</a> : <b>GroupNonUniformBallot</b>  <a href="#">Missing before version 1.3.</a>		
5	339	<id> <i>Result Type</i>	Result <id>	Scope <id> <i>Execution</i>	<id> <i>Predicate</i>

<b>OpGroupNonUniformInverseBallot</b>  Evaluates a value for all active invocations in the group, resulting in <b>true</b> if the bit in <i>Value</i> for the corresponding invocation is set to one, otherwise the result is <b>false</b> .  <i>Result Type</i> must be a <a href="#">Boolean type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup</b> <a href="#">Scope</a> .  <i>Value</i> must be a vector of four components of <a href="#">integer type</a> scalar, whose <i>Signedness</i> operand is 0.  <i>Value</i> must be the same for all invocations that execute the same dynamic instance of this instruction.  <i>Value</i> is a set of bitfields where the first invocation is represented in the lowest bit of the first vector component and the last (up to the size of the group) is the higher bit number of the last bitmask needed to represent all bits of the group invocations.			<a href="#">Capability</a> : <b>GroupNonUniformBallot</b>  <a href="#">Missing before version 1.3.</a>		
5	340	<id> <i>Result Type</i>	Result <id>	Scope <id> <i>Execution</i>	<id> <i>Value</i>

<b>OpGroupNonUniformBallotBitExtract</b>  Evaluates a value for all active invocations in the group, resulting in <b>true</b> if the bit in <i>Value</i> that corresponds to <i>Index</i> is set to one, otherwise the result is <b>false</b> .  <i>Result Type</i> must be a <b>Boolean type</b> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  <i>Value</i> must be a vector of four components of <b>integer type</b> scalar, whose <i>Signedness</i> operand is 0.  <i>Value</i> is a set of bitfields where the first invocation is represented in the lowest bit of the first vector component and the last (up to the size of the group) is the higher bit number of the last bitmask needed to represent all bits of the group invocations.  <i>Index</i> must be a scalar of <b>integer type</b> , whose <i>Signedness</i> operand is 0.  The resulting value is undefined if <i>Index</i> is greater than or equal to the size of the group.				<b>Capability:</b> <b>GroupNonUniformBallot</b>  <b>Missing before version 1.3.</b>		
6	341	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<b>Scope &lt;id&gt;</b> <i>Execution</i>	<id> <i>Value</i>	<id> <i>Index</i>

<b>OpGroupNonUniformBallotBitCount</b>  A group operation that returns the number of bits that are set to 1 in <i>Value</i> , only considering the bits in <i>Value</i> required to represent all bits of the group’s invocations.  <i>Result Type</i> must be a scalar of <b>integer type</b> , whose <i>Signedness</i> operand is 0.  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity <i>I</i> for <i>Operation</i> is 0.  <i>Value</i> must be a vector of four components of <b>integer type</b> scalar, whose <i>Signedness</i> operand is 0.  <i>Value</i> is a set of bitfields where the first invocation is represented in the lowest bit of the first vector component and the last (up to the size of the group) is the higher bit number of the last bitmask needed to represent all bits of the group invocations.				<b>Capability:</b> <b>GroupNonUniformBallot</b>  <b>Missing before version 1.3.</b>		
6	342	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<b>Scope &lt;id&gt;</b> <i>Execution</i>	<b>Group Operation</b> <i>Operation</i>	<id> <i>Value</i>

<b>OpGroupNonUniformBallotFindLSB</b>  Find the least significant bit set to 1 in <i>Value</i> , considering only the bits in <i>Value</i> required to represent all bits of the group's invocations. If none of the considered bits is set to 1, the result is undefined.  <i>Result Type</i> must be a scalar of <i>integer type</i> , whose <i>Signedness</i> operand is 0.  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  <i>Value</i> must be a vector of four components of <i>integer type</i> scalar, whose <i>Signedness</i> operand is 0.  <i>Value</i> is a set of bitfields where the first invocation is represented in the lowest bit of the first vector component and the last (up to the size of the group) is the higher bit number of the last bitmask needed to represent all bits of the group invocations.				Capability: <b>GroupNonUniformBallot</b>  Missing before version 1.3.	
5	343	<id> <i>Result Type</i>	Result <id>	Scope <id> <i>Execution</i>	<id> <i>Value</i>

<b>OpGroupNonUniformBallotFindMSB</b>  Find the most significant bit set to 1 in <i>Value</i> , considering only the bits in <i>Value</i> required to represent all bits of the group's invocations. If none of the considered bits is set to 1, the result is undefined.  <i>Result Type</i> must be a scalar of <i>integer type</i> , whose <i>Signedness</i> operand is 0.  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  <i>Value</i> must be a vector of four components of <i>integer type</i> scalar, whose <i>Signedness</i> operand is 0.  <i>Value</i> is a set of bitfields where the first invocation is represented in the lowest bit of the first vector component and the last (up to the size of the group) is the higher bit number of the last bitmask needed to represent all bits of the group invocations.				Capability: <b>GroupNonUniformBallot</b>  Missing before version 1.3.	
5	344	<id> <i>Result Type</i>	Result <id>	Scope <id> <i>Execution</i>	<id> <i>Value</i>

<b>OpGroupNonUniformShuffle</b>  Return the <i>Value</i> of the <a href="#">invocation</a> identified by the id <i>Id</i> .  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> , <a href="#">integer type</a> , or <a href="#">Boolean type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The type of <i>Value</i> must be the same as <i>Result Type</i> .  <i>Id</i> must be a scalar of <a href="#">integer type</a> , whose <i>Signedness</i> operand is 0.  The resulting value is undefined if <i>Id</i> is an inactive invocation, or is greater than or equal to the size of the group.				<a href="#">Capability:</a> <b>GroupNonUniformShuffle</b>  <a href="#">Missing before version 1.3.</a>			
6	345	<a href="#">&lt;id&gt;</a> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Scope &lt;id&gt;</a> <i>Execution</i>	<a href="#">&lt;id&gt;</a> <i>Value</i>	<a href="#">&lt;id&gt;</a> <i>Id</i>	

<b>OpGroupNonUniformShuffleXor</b>				<b>Capability:</b> <b>GroupNonUniformShuffle</b>		
Return the <i>Value</i> of the <b>invocation</b> identified by the current invocation's id within the group xor'ed with <i>Mask</i> .				Missing before <b>version 1.3</b> .		
<i>Result Type</i> must be a scalar or vector of <b>floating-point type</b> , <b>integer type</b> , or <b>Boolean type</b> .						
<i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .						
The type of <i>Value</i> must be the same as <i>Result Type</i> .						
<i>Mask</i> must be a scalar of <b>integer type</b> , whose <i>Signedness</i> operand is 0.						
The resulting value is undefined if current invocation's id within the group xor'ed with <i>Mask</i> is an inactive invocation, or is greater than or equal to the size of the group.						
6	346	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<b>Scope &lt;id&gt;</b> <i>Execution</i>	<id> <i>Value</i>	<id> <i>Mask</i>

<b>OpGroupNonUniformShuffleUp</b>  Return the <i>Value</i> of the <a href="#">invocation</a> identified by the current invocation's id within the group - <i>Delta</i> .  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> , <a href="#">integer type</a> , or <a href="#">Boolean type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The type of <i>Value</i> must be the same as <i>Result Type</i> .  <i>Delta</i> must be a scalar of <a href="#">integer type</a> , whose <i>Signedness</i> operand is 0.  <i>Delta</i> is treated as unsigned and the resulting value is undefined if <i>Delta</i> is greater than the current invocation's id within the group or if the selected lane is inactive.				<b>Capability:</b> <b>GroupNonUniformShuffleRelative</b>  <a href="#">Missing before version 1.3.</a>		
6	347	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Scope &lt;id&gt;</a> <i>Execution</i>	<id> <i>Value</i>	<id> <i>Delta</i>

<b>OpGroupNonUniformShuffleDown</b>  Return the <i>Value</i> of the <a href="#">invocation</a> identified by the current invocation's id within the group + <i>Delta</i> .  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> , <a href="#">integer type</a> , or <a href="#">Boolean type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The type of <i>Value</i> must be the same as <i>Result Type</i> .  <i>Delta</i> must be a scalar of <a href="#">integer type</a> , whose <i>Signedness</i> operand is 0.  <i>Delta</i> is treated as unsigned and the resulting value is undefined if <i>Delta</i> is greater than or equal to the size of the group, or if the current invocation's id within the group + <i>Delta</i> is either an inactive invocation or greater than or equal to the size of the group.				<b>Capability:</b> <b>GroupNonUniformShuffleRelative</b>  <a href="#">Missing before version 1.3.</a>		
6	348	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Scope &lt;id&gt;</a> <i>Execution</i>	<id> <i>Value</i>	<id> <i>Delta</i>

<b>OpGroupNonUniformIAdd</b>  An integer add <a href="#">group operation</a> of all <i>Value</i> operands contributed active by <a href="#">invocations</a> in the group.  <i>Result Type</i> must be a scalar or vector of <a href="#">integer type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity <i>I</i> for <i>Operation</i> is 0. If <i>Operation</i> is <b>ClusteredReduce</b> , <i>ClusterSize</i> must be specified.  The type of <i>Value</i> must be the same as <i>Result Type</i> .  <i>ClusterSize</i> is the size of cluster to use. <i>ClusterSize</i> must be a scalar of <a href="#">integer type</a> , whose <i>Signedness</i> operand is 0. <i>ClusterSize</i> must come from a <a href="#">constant instruction</a> . <i>ClusterSize</i> must be at least 1, and must be a power of 2. If <i>ClusterSize</i> is greater than the declared <b>SubGroupSize</b> , executing this instruction results in undefined behavior.					<a href="#">Capability</a> : <b>GroupNonUniformArithmetic</b> , <b>GroupNonUniformClustered</b> , <b>GroupNonUniformPartitionedNV</b>  <a href="#">Missing before version 1.3</a> .		
6 + variable	349	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Scope &lt;id&gt;</a> <i>Execution</i>	<a href="#">Group Operation</a> <i>Operation</i>	<id> <i>Value</i>	Optional <id> <i>ClusterSize</i>

<b>OpGroupNonUniformFAdd</b>  A floating point add <a href="#">group operation</a> of all <i>Value</i> operands contributed by active <a href="#">invocations</a> in the group.  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity <i>I</i> for <i>Operation</i> is 0. If <i>Operation</i> is <b>ClusteredReduce</b> , <i>ClusterSize</i> must be specified.  The type of <i>Value</i> must be the same as <i>Result Type</i> . The method used to perform the group operation on the contributed <i>Value</i> (s) from active invocations is implementation defined.  <i>ClusterSize</i> is the size of cluster to use. <i>ClusterSize</i> must be a scalar of <a href="#">integer type</a> , whose <i>Signedness</i> operand is 0. <i>ClusterSize</i> must come from a <a href="#">constant instruction</a> . <i>ClusterSize</i> must be at least 1, and must be a power of 2. If <i>ClusterSize</i> is greater than the declared <b>SubGroupSize</b> , executing this instruction results in undefined behavior.					<a href="#">Capability</a> : <b>GroupNonUniformArithmetic</b> , <b>GroupNonUniformClustered</b> , <b>GroupNonUniformPartitionedNV</b>  <a href="#">Missing before version 1.3</a> .		
6 + variable	350	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Scope &lt;id&gt;</a> <i>Execution</i>	<a href="#">Group Operation</a> <i>Operation</i>	<id> <i>Value</i>	Optional <id> <i>ClusterSize</i>

<b>OpGroupNonUniformIMul</b>  An integer multiply <a href="#">group operation</a> of all <i>Value</i> operands contributed by active <a href="#">invocations</a> in the group.  <i>Result Type</i> must be a scalar or vector of <a href="#">integer type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity <i>I</i> for <i>Operation</i> is 1. If <i>Operation</i> is <b>ClusteredReduce</b> , <i>ClusterSize</i> must be specified.  The type of <i>Value</i> must be the same as <i>Result Type</i> .  <i>ClusterSize</i> is the size of cluster to use. <i>ClusterSize</i> must be a scalar of <a href="#">integer type</a> , whose <i>Signedness</i> operand is 0. <i>ClusterSize</i> must come from a <a href="#">constant instruction</a> . <i>ClusterSize</i> must be at least 1, and must be a power of 2. If <i>ClusterSize</i> is greater than the declared <b>SubGroupSize</b> , executing this instruction results in undefined behavior.					<a href="#">Capability</a> : <b>GroupNonUniformArithmetic</b> , <b>GroupNonUniformClustered</b> , <b>GroupNonUniformPartitionedNV</b>  <a href="#">Missing before version 1.3</a> .

<b>OpGroupNonUniformSMax</b>  A signed integer maximum <b>group operation</b> of all <i>Value</i> operands contributed by active <b>invocations</b> in the group.  <i>Result Type</i> must be a scalar or vector of <b>integer type</b> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity <i>I</i> for <i>Operation</i> is INT_MIN. If <i>Operation</i> is <b>ClusteredReduce</b> , <i>ClusterSize</i> must be specified.  The type of <i>Value</i> must be the same as <i>Result Type</i> .  <i>ClusterSize</i> is the size of cluster to use. <i>ClusterSize</i> must be a scalar of <b>integer type</b> , whose <i>Signedness</i> operand is 0. <i>ClusterSize</i> must come from a <b>constant instruction</b> . <i>ClusterSize</i> must be at least 1, and must be a power of 2. If <i>ClusterSize</i> is greater than the declared <b>SubGroupSize</b> , executing this instruction results in undefined behavior.					<b>Capability:</b> <b>GroupNonUniformArithmetic,</b> <b>GroupNonUniformClustered,</b> <b>GroupNonUniformPartitionedNV</b>  <b>Missing before version 1.3.</b>		
6 + variable	356	<id> <i>Result Type</i>	<b>Result &lt;id&gt;</b>	<b>Scope &lt;id&gt;</b> <i>Execution</i>	<b>Group Operation Operation</b>	<id> <i>Value</i>	Optional <id> <i>ClusterSize</i>

<b>OpGroupNonUniformUMax</b>  An unsigned integer maximum <a href="#">group operation</a> of all <i>Value</i> operands contributed by active <a href="#">invocations</a> in the group.  <i>Result Type</i> must be a scalar or vector of <a href="#">integer type</a> , whose <i>Signedness</i> operand is 0.  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity <i>I</i> for <i>Operation</i> is 0. If <i>Operation</i> is <b>ClusteredReduce</b> , <i>ClusterSize</i> must be specified.  The type of <i>Value</i> must be the same as <i>Result Type</i> .  <i>ClusterSize</i> is the size of cluster to use. <i>ClusterSize</i> must be a scalar of <a href="#">integer type</a> , whose <i>Signedness</i> operand is 0. <i>ClusterSize</i> must come from a <a href="#">constant instruction</a> . <i>ClusterSize</i> must be at least 1, and must be a power of 2. If <i>ClusterSize</i> is greater than the declared <b>SubGroupSize</b> , executing this instruction results in undefined behavior.					<a href="#">Capability</a> : <b>GroupNonUniformArithmetic</b> , <b>GroupNonUniformClustered</b> , <b>GroupNonUniformPartitionedNV</b>  <a href="#">Missing before version 1.3.</a>		
6 + variable	357	<id> <i>Result Type</i>	<a href="#">Result &lt;id&gt;</a>	<a href="#">Scope &lt;id&gt;</a> <i>Execution</i>	<a href="#">Group Operation</a> <i>Operation</i>	<id> <i>Value</i>	Optional <id> <i>ClusterSize</i>

<b>OpGroupNonUniformFMax</b>  A floating point maximum <a href="#">group operation</a> of all <i>Value</i> operands contributed by active <a href="#">invocations</a> in by group.  <i>Result Type</i> must be a scalar or vector of <a href="#">floating-point type</a> .  <i>Execution</i> must be <b>Workgroup</b> or <b>Subgroup Scope</b> .  The identity <i>I</i> for <i>Operation</i> is -INF. If <i>Operation</i> is <b>ClusteredReduce</b> , <i>ClusterSize</i> must be specified.  The type of <i>Value</i> must be the same as <i>Result Type</i> . The method used to perform the group operation on the contributed <i>Value(s)</i> from active invocations is implementation defined. From the set of <i>Value(s)</i> provided by active invocations within a subgroup, if for any two <i>Values</i> one of them is a NaN, the other is chosen. If all <i>Value(s)</i> that are used by the current invocation are NaN, then the result is an undefined value.  <i>ClusterSize</i> is the size of cluster to use. <i>ClusterSize</i> must be a scalar of <a href="#">integer type</a> , whose <i>Signedness</i> operand is 0. <i>ClusterSize</i> must come from a <a href="#">constant instruction</a> . <i>ClusterSize</i> must be at least 1, and must be a power of 2. If <i>ClusterSize</i> is greater than the declared <b>SubGroupSize</b> , executing this instruction results in undefined behavior.					<a href="#">Capability</a> : <b>GroupNonUniformArithmetic</b> , <b>GroupNonUniformClustered</b> , <b>GroupNonUniformPartitionedNV</b>  <a href="#">Missing before version 1.3.</a>

## A Changes

### A.1 Changes from Version 0.99, Revision 31

- Added the **PushConstant Storage Class**.
- Added **OpIAddCarry**, **OpISubBorrow**, **OpUMulExtended**, and **OpSMulExtended**.
- Added **OpInBoundsPtrAccessChain**.
- Added the **Decoration NoContraction** to prevent combining multiple operations into a single operation (bug 14396).
- Added sparse texturing (14486):
  - Added **OpImageSparse...** for accessing images that might not be resident.
  - Added **MinLod** functionality for accessing images with a minimum level of detail.
- Added back the **Alignment Decoration**, for the **Kernel** capability (14505).
- Added a **NonTemporal Memory Access** (14566).
- **Structured control flow** changes:
  - Changed structured loops to have a structured continue *Continue Target* in **OpLoopMerge** (14422).
  - Added rules for how "fall through" works with **OpSwitch** (13579).
  - Added definitions for what is "inside" a structured control-flow construct (14422).
- Added **SubpassData Dim** to support input targets written by a previous subpass as an output target (14304). This is also a **Decoration** and a **Capability**, and can be used by some image ops to read the input target.
- Added **OpTypeForwardPointer** to establish the Storage Class of a forward reference to a pointer type (13822).
- Improved Debuggability
  - Changed **OpLine** to not have a target *<id>*, but instead be placed immediately preceding the instruction(s) it is annotating (13905).
  - Added **OpNoLine** to terminate the affect of **OpLine** (13905).
  - Changed **OpSource** to include the source code:
    - \* Allow multiple occurrences.
    - \* Be mixed in with the **OpString** instructions.
    - \* Optionally consume an **OpString** result to say which file it is annotating.
    - \* Optionally include the source text corresponding to that **OpString**.
    - \* Included adding **OpSourceContinued** for source text that is too long for a single instruction.
- Added a large number of **Capabilities** for subsetting functionality (14520, 14453), including 8-bit integer support for OpenCL kernels.
- Added **VertexIndex** and **InstanceIndex BuiltIn Decorations** (14255).
- Added **GenericPointer** capability that allows the ability to use the **Generic Storage Class** (14287).
- Added **IndependentForwardProgress Execution Mode** (14271).
- Added **OpAtomicFlagClear** and **OpAtomicFlagTestAndSet** instructions (14315).
- Changed **OpEntryPoint** to take a list of **Input** and **Output** *<id>* for declaring the entry point's interface.
- Fixed internal bugs
  - 14411 Added missing documentation for mad\_sat OpenCL extended instructions (enums existed, just the documentation was missing)
  - 14241 Removed shader capability requirement from **OpImageQueryLevels** and **OpImageQuerySamples**.
  - 14241 Removed unneeded **OpImageQueryDim** instruction.

- 14241 Filled in *TBD* section for `OpAtomicCompareExchangeWeak`
- 14366 All `OpSampledImage` must appear before uses of sampled images (and still in the first block of the entry point).
- 14450 `DeviceEnqueue` capability is required for `OpTypeQueue` and `OpTypeDeviceEvent`
- 14363 `OpTypePipe` is opaque - moved packet size and alignment to opcodes
- 14367 `Float16Buffer` capability clarified
- 14241 Clarified how `OpSampledImage` can be used
- 14402 Clarified `OpTypeImage` encodings for OpenCL extended instructions
- 14569 Removed mention of non-existent `OpFunctionDecl`
- 14372 Clarified usage of `OpGenericPtrMemSemantics`
- 13801 Clarified the `SpecId Decoration` is just for constants
- 14447 Changed literal values of `Memory Semantic` enums to match OpenCL/C++11 atomics, and made the `Memory Semantic None` and `Relaxed` be aliases
- 14637 Removed subgroup scope from `OpGroupAsyncCopy` and `OpGroupWaitEvents`

## A.2 Changes from Version 0.99, Revision 32

- Added `UnormInt101010_2` to the `Image Channel Data Type` table.
- Added place holder for C++11 atomic *Consume* Memory Semantics along with an explicit `AcquireRelease` memory semantic.
- Fixed internal bugs:
  - 14690 `OpSwitch` *literal* width (and hence number of operands) is determined by the type of *Selector*, and be rigorous about how sub-32-bit literals are stored.
  - 14485 The client API owns the semantics of built-ins that only have "pass through" semantics WRT SPIR-V.
  - 14862 Removed the `IndependentForwardProgress Execution Mode`.
- Fixed public bugs:
  - 1387 Don't describe result type of `OpImageWrite`.

## A.3 Changes from Version 1.00, Revision 1

- Adjusted `Capabilities`:
  - Split geometry-stream functionality into its own `GeometryStreams` capability (14873).
  - Have `InputAttachmentIndex` to depend on `InputAttachment` instead of `Shader` (14797).
  - Merge `AdvancedFormats` and `StorageImageExtendedFormats` into just `StorageImageExtendedFormats` (14824).
  - Require `StorageImageReadWithoutFormat` and `StorageImageWriteWithoutFormat` to read and write storage images with an `Unknown Image Format`.
  - Removed the `ImageSRGBWrite` capability.
- Clarifications
  - `RelaxedPrecision Decoration` can be applied to `OpFunction` (14662).
- Fixed internal bugs:
  - 14797 The literal argument was missing for the `InputAttachmentIndex Decoration`.
  - 14547 Remove the `FragColor BuiltIn`, so that no implicit broadcast is implied.
  - 13292 Make statements about "Volatile" be more consistent with the memory model specification (non-functional change).

- 14948 Remove image-"Query" overloading on image/sampled-image type and "fetch" on non-sampled images, by adding the [OpImage](#) instruction to get the image from a sampled image.
  - 14949 Make consistent placement between **OpSource** and **OpSourceExtension** in the [logical layout](#) of a module.
  - 14865 Merge **WorkgroupLinearId** with **LocalInvocationId** [BuiltIn Decorations](#).
  - 14806 Include 3D images for [OpImageQuerySize](#).
  - 14325 Removed the **Smooth Decoration**.
  - 12771 Make the version word formatted as: "0 | Major Number | Minor Number | 0" in the [physical layout](#).
  - 15035 Allow [OpTypeImage](#) to use a *Depth* operand of 2 for not indicating a depth or non-depth image.
  - 15009 Split the **OpenCL Source Language** into two: **OpenCL\_C** and **OpenCL\_CPP**.
  - 14683 [OpSampledImage](#) instructions can only be the consuming block, for scalars, and directly consumed by an image lookup or query instruction.
  - 14325 mutual exclusion validation rules of [Execution Modes](#) and [Decorations](#)
  - 15112 add definitions for [invocation](#), [dynamically uniform](#), and [uniform control flow](#).
- Renames
    - **InputTargetIndex** [Decoration](#) → **InputAttachmentIndex**
    - **InputTarget** [Capability](#) → **InputAttachment**
    - **InputTarget** **Dim** → **SubpassData**
    - **WorkgroupLocal** [Storage Class](#) → **Workgroup**
    - **WorkgroupGlobal** [Storage Class](#) → **CrossWorkgroup**
    - **PrivateGlobal** [Storage Class](#) → **Private**
    - **OpAsyncGroupCopy** → [OpGroupAsyncCopy](#)
    - **OpWaitGroupEvents** → [OpGroupWaitEvents](#)
    - **InputTriangles** [Execution Mode](#) → **Triangles**
    - **InputQuads** [Execution Mode](#) → **Quads**
    - **InputIsolines** [Execution Mode](#) → **Isolines**

## A.4 Changes from Version 1.00, Revision 2

- Updated example at the end of Section 1 to conform to the KHR\_vulkan\_glsl extension and treat **OpTypeBool** as an abstract type.
- Adjusted [Capabilities](#):
  - **MatrixStride** depends on **Matrix** (15234).
  - **Sample**, **SampleId**, **SamplePosition**, and **SampleMask** depend on **SampleRateShading** (15234).
  - **ClipDistance** and **CullDistance** [BuiltIns](#) depend on, respectively, **ClipDistance** and **CullDistance** (1407, 15234).
  - **ViewportIndex** depends on **MultiViewport** (15234).
  - **AtomicCounterMemory** should be the **AtomicStorage** (15234).
  - **Float16** has no dependencies (15234).
  - **Offset** [Decoration](#) should only be for **Shader** (15268).
  - **Generic** [Storage Class](#) is supposed to need the **GenericPointer** [Capability](#) (14287).
  - Remove capability restriction on the **BuiltIn** [Decoration](#) (15248).
- Fixed internal bugs:
  - 15203 Updated description of **SampleMask** [BuiltIn](#) to include "Input or output. . .", not just "Input. . ."
  - 15225 Include no re-association as a constraint required by the **NoContraction** [Decoration](#).
  - 15210 Clarify [OpPhi](#) semantics that operand values only come from parent blocks.

- 15239 Add [OpImageSparseRead](#), which was missing (supposed to be 12 sparse-image instructions, but only 11 got incorporated, this adds the 12th).
- 15299 Move [OpUndef](#) back to the Miscellaneous section.
- 15321 [OpTypeImage](#) does not have a *Depth* restriction when used with **SubpassData**.
- 14948 Fix the **Lod Image Operands** to allow both integer and floating-point values.
- 15275 Clarify specific storage classes allowed for atomic operations under universal validation rules "Atomic access rules".
- 15501 Restrict **Patch Decoration** to one of the tessellation execution models.
- 15472 Reserved use of [OpImageSparseSampleProjImplicitLod](#), [OpImageSparseSampleProjExplicitLod](#), [OpImageSparseSampleProjDrefImplicitLod](#), and [OpImageSparseSampleProjDrefExplicitLod](#).
- 15459 Clarify what makes different aggregate types in "Types and Variables".
- 15426 Don't require [OpQuantizeToF16](#) to preserve NaN patterns.
- 15418 Don't set both **Acquire** and **Release** bits in [Memory Semantics](#).
- 15404 [OpFunction Result](#) *<id>* can only be used by **OpFunctionCall**, **OpEntryPoint**, and decoration instructions.
- 15437 Restrict element type for [OpTypeRuntimeArray](#) by adding a definition of **concrete** types.
- 15403 Clarify [OpTypeFunction](#) can only be consumed by [OpFunction](#) and functions can only return concrete and abstract types.
- Improved accuracy of the opcode word count in each instruction regarding which operands are optional. For sampling operations with explicit LOD, this included not marking the required LOD operands as optional.
- Clarified that when **NonWritable**, **NonReadable**, **Volatile**, and **Coherent Decorations** are applied to the **Uniform** storage class, the **BufferBlock** decoration must be present.
- Fixed external bugs:
  - 1413 (see internal 15275)
  - 1417 Added definitions for block, [dominate](#), [post dominate](#), CFG, and [back edge](#). Removed use of "dominator tree".

## A.5 Changes from Version 1.00, Revision 3

- Added definition of [derivative group](#), and use it to say when derivatives are well defined.

## A.6 Changes from Version 1.00, Revision 4

- Expanded the list of instructions that may use or return a pointer in the **Logical addressing model**.
- Added missing ABGR [Image Channel Order](#)

## A.7 Changes from Version 1.00, Revision 5

- Khronos SPIR-V issue #27: Removed **Shader** dependency from **SampledBuffer** and **Sampled1D Capabilities**.
- Khronos SPIR-V issue #56: Clarify that the meaning of "read-only" in the [Storage Classes](#) includes not allowing initializers.
- Khronos SPIR-V issue #57: Clarify "modulo" means "remainder" in [OpFMod](#)'s description.
- Khronos SPIR-V issue #60: [OpControlBarrier](#) synchronizes **Output** variables when used in tessellation-control shader.
- Public SPIRV-Headers issue #1: Remove the **Shader** capability requirement from the **Input Storage Class**.
- Public SPIRV-Headers issue #10: Don't say the  $(u [ , v ] [ , w ], q)$  has four components, as it can be closed up when the optional ones are missing. Seen in the [projective image](#) instructions.
- Public SPIRV-Headers issues #12 and #13 and Khronos SPIR-V issue #65: Allow [OpVariable](#) as an initializer for another **OpVariable** instruction or the *Base* of an [OpSpecConstantOp](#) with an **AccessChain** opcode.
- Public SPIRV-Headers issues #14: add **Max** enumerants of 0x7FFFFFFF to each of the non-mask enums in the C-based header files.

## A.8 Changes from Version 1.00, Revision 6

- Khronos SPIR-V issue #63: Be clear that **OpUndef** can be used in sequence 9 (and is preferred to be) of the [Logical Layout](#) and can be part of partially-defined [OpConstantComposite](#).
- Khronos SPIR-V issue #70: Don't explicitly require operand truncation for integer operations when operating at [RelaxedPrecision](#).
- Khronos SPIR-V issue #76: Include **OpINEqual** in the list of allowed instructions for [OpSpecConstantOp](#).
- Khronos SPIR-V issue #79: Remove implication that [OpImageQueryLod](#) should have a component for the array index.
- Public SPIRV-Headers issue #17: [Decorations Noperspective](#), **Flat**, **Patch**, **Centroid**, and **Sample** can apply to a top-level member that is itself a structure, so don't disallow it through restrictions to numeric types.

## A.9 Changes from Version 1.00, Revision 7

- Khronos SPIR-V issue #69: [OpImageSparseFetch](#) editorial change in summary: include that it is sampled image.
- Khronos SPIR-V issue #74: [OpImageQueryLod](#) requires a sampler.
- Khronos SPIR-V issue #82: Clarification to the **Float16Buffer Capability**.
- Khronos SPIR-V issue #89: Editorial improvements to [OpMemberDecorate](#) and [OpDecorationGroup](#).

## A.10 Changes from Version 1.00, Revision 8

- Add SPV\_KHR\_subgroup\_vote tokens.
- Typo: Change "without a sampler" to "with a sampler" for the description of the [SampledBuffer](#) Capability.
- Khronos SPIR-V issue #61: Clarification of packet size and alignment on all instructions that use the [Pipes](#) Capability.
- Khronos SPIR-V issue #99: Use "invalid" language to replace any "compile-time error" language.
- Khronos SPIR-V issue #55: Distinguish between [branch instructions](#) and [termination instructions](#).
- Khronos SPIR-V issue #94: Add missing [OpSubgroupReadInvocationKHR](#) enumerant.
- Khronos SPIR-V issue #114: Header blocks [strictly dominate](#) their merge blocks.
- Khronos SPIR-V issue #119: [OpSpecConstantOp](#) allows **OpUndef** where allowed by its *opcode*.

## A.11 Changes from Version 1.00, Revision 9

- Khronos Vulkan issue #652: Remove statements about matrix offsets and padding. These are described correctly in the Vulkan API specifications.
- Khronos SPIR-V issue #113: Remove the "By Default" statements in [FP Rounding Mode](#). These should be properly specified by the client API.
- Add extension enumerants for
  - SPV\_KHR\_16bit\_storage
  - SPV\_KHR\_device\_group
  - SPV\_KHR\_multiview
  - SPV\_NV\_sample\_mask\_override\_coverage
  - SPV\_NV\_geometry\_shader\_passthrough
  - SPV\_NV\_viewport\_array2
  - SPV\_NV\_stereo\_view\_rendering
  - SPV\_NVX\_multiview\_per\_view\_attributes

## A.12 Changes from Version 1.00, Revision 10

- Add **HLSL** [source language](#).
- Add **StorageBuffer** [storage class](#).
- Add **StorageBuffer16BitAccess**, **UniformAndStorageBuffer16BitAccess**, **VariablePointersStorageBuffer**, and **VariablePointers** [capabilities](#).
- Khronos SPIR-V issue #163: Be more clear that **OpTypeStruct** allows zero members. Also affects **ArrayStride** and **Offset** decoration [validation rules](#).
- Khronos SPIR-V issue #159: List allowed **AtomicCounter** instructions with the **AtomicStorage** [capability](#) rather than the validation rules.
- Khronos SPIR-V issue #36: Describe more clearly the type of *ND Range* in **OpGetKernelNDrangeSubGroupCount**, **OpGetKernelNDrangeMaxSubGroupSize**, and **OpEnqueueKernel**.
- Khronos SPIR-V issue #128: Be clear the **OpDot** operates only on vectors.
- Khronos SPIR-V issue #80: Loop headers must dominate their continue target. See [Structured Control Flow](#).
- Khronos SPIR-V issue #150 allow **UniformConstant** [storage-class](#) variables to have initializers, depending on the client API.

## A.13 Changes from Version 1.00, Revision 11

- Public issue #2: Disallow the **Cube** dimension from use with the **Offset**, **ConstOffset**, and **ConstOffset** [image operands](#).
- Public issue #48: **OpConvertPtrToU** only returns a scalar, not a vector.
- Khronos SPIR-V issue #130: Be more clear which masks are literal and which are not.
- Khronos SPIR-V issue #154: Clarify only one of the listed [Capabilities](#) needs to be declared to use a feature that lists multiple capabilities. The non-declared capabilities need not be supported by the underlying implementation.
- Khronos SPIR-V issue #174: **OpImageDrefGather** and **OpImageSparseDrefGather** return vectors, not scalars.
- Khronos SPIR-V issue #182: The **SampleMask** [built in](#) does not depend on **SampleRateShading**, only **Shader**.
- Khronos SPIR-V issue #183: **OpQuantizeToF16** with too-small magnitude can result in either +0 or -0.
- Khronos SPIR-V issue #203: **OpImageTexelPointer** has 3 components for cube arrays, not 4.
- Khronos SPIR-V issue #217: Clearer language for **OpArrayLength**.
- Khronos SPIR-V issue #213: **Image Operand LoD** is not used by query operations.
- Khronos SPIR-V issue #223: **OpPhi** has exactly one parent operand per parent block.
- Khronos SPIR-V issue #212: In the [Validation Rules](#), make clear a pointer can be an operand in an extended instruction set.
- Add extension enumerants for
  - SPV\_AMD\_shader\_ballot
  - SPV\_KHR\_post\_depth\_coverage
  - SPV\_AMD\_shader\_explicit\_vertex\_parameter
  - SPV\_EXT\_shader\_stencil\_export
  - SPV\_INTEL\_subgroups

## A.14 Changes from Version 1.00

- Moved version number to SPIR-V 1.1
- New functionality:
  - Bug 14202 named barriers:
    - \* Added the **NamedBarrier Capability**.
    - \* Added the instructions: **OpTypeNamedBarrier**, **OpNamedBarrierInitialize**, and **OpMemoryNamedBarrier**.
  - Bug 14201 subgroup dispatch:
    - \* Added the **SubgroupDispatch Capability**.
    - \* Added the instructions: **OpGetKernelLocalSizeForSubgroupCount** and **OpGetKernelMaxNumSubgroups**.
    - \* Added **SubgroupSize** and **SubgroupsPerWorkgroup Execution Modes**.
  - Bug 14441 program-scope pipes:
    - \* Added the **PipeStorage Capability**.
    - \* Added Instructions: **OpTypePipeStorage**, **OpConstantPipeStorage**, and **OpCreatePipeFromPipeStorage**.
  - Bug 15434 Added the **OpSizeOf** instruction.
  - Bug 15024 support for OpenCL-C++ ivdep loop attribute:
    - \* Added **DependencyInfinite** and **DependencyLength Loop Controls**.
    - \* Updated **OpLoopMerge** to support these.
  - Bug 14022 Added **Initializer** and **Finalizer** and **Execution Modes**.
  - Bug 15539 Added the **MaxByteOffset Decoration**.
  - Bug 15073 Added the **Kernel Capability** to the **SpecId Decoration**.
  - Bug 14828 Added the **OpModuleProcessed** instruction.
- Fixed internal bugs:
  - Bug 15481 Clarification on alignment and size operands for pipe operands

## A.15 Changes from Version 1.1, Revision 1

- Incorporated bug fixes from Revision 6 of Version 1.00 (see section 4.7. Changes from Version 1.00, Revision 5).

## A.16 Changes from Version 1.1, Revision 2

- Incorporated bug fixes from Revision 7 of Version 1.00 (see section 4.8. Changes from Version 1.00, Revision 6).

## A.17 Changes from Version 1.1, Revision 3

- Incorporated bug fixes from Revision 8 of Version 1.00 (see section 4.9. Changes from Version 1.00, Revision 7).

## A.18 Changes from Version 1.1, Revision 4

- Incorporated bug fixes from Revision 9 of Version 1.00 (see section 4.10. Changes from Version 1.00, Revision 8).

## A.19 Changes from Version 1.1, Revision 5

- Incorporated changes from Revision 10 of Version 1.00 (see section 4.11. Changes from Version 1.00, Revision 9).

## A.20 Changes from Version 1.1, Revision 6

- Incorporated changes from Revision 11 of Version 1.00 (see section 4.12. Changes from Version 1.00, Revision 10).

## A.21 Changes from Version 1.1, Revision 7

- Incorporated changes from Revision 12 of Version 1.00 (see section 4.13. Changes from Version 1.00, Revision 11).
- State where all [OpModuleProcessed](#) belong, in [the logical layout](#).

## A.22 Changes from Version 1.1

- Moved version number to SPIR-V 1.2
- New functionality:
  - Added [OpExecutionModelId](#) to allow using an *<id>* to set the [execution modes](#) [SubgroupsPerWorkgroupId](#), [LocalSizeId](#), and [LocalSizeHintId](#).
  - Added [OpDecorateId](#) to allow using an *<id>* to set the [decorations](#) [AlignmentId](#) and [MaxByteOffsetId](#).

## A.23 Changes from Version 1.2, Revision 1

- Incorporated changes from Revision 12 of Version 1.00 (see section 4.13. Changes from Version 1.00, Revision 11).
- Incorporated changes from Revision 8 of Version 1.1 (see section 4.21. Changes from Version 1.1, Revision 7).

## A.24 Changes from Version 1.2, Revision 2

- Combine the 1.0, 1.1, and 1.2 specifications, making a [unified specification](#). The previous 1.0, 1.1, and 1.2 specifications are replaced with this one unified specification.

## A.25 Changes from Version 1.2, Revision 3

Fixed Khronos-internal issues:

- #249: Improve description of [OpTranspose](#).
- #251: Undefined values in [OpUndef](#) include abstract and opaque values.
- #258: Deprecate [OpAtomicCompareExchangeWeak](#) in favor of [OpAtomicCompareExchange](#).
- #241: Use "invalid" instead of "compile-time" error for [ConstOffsets](#).
- #248: [OpImageSparseRead](#) is not for [SubpassData](#).
- #257: Allow [OpImageSparseFetch](#) and [OpImageSparseRead](#) with the [Sample image operands](#).
- #229: Some sensible constraints on branch hints for [OpBranchConditional](#).
- #236: [OpVariable](#)'s storage class must match storage class of the pointer type.
- #216: Can [decorate pointer types](#) with [Coherent](#) and [Volatile](#).
- #247: Don't say [Scope <id>](#) is a mask; it is not.
- #254: Remove [validation](#) rules about the types atomic instructions can operate on. These rules belong instead to the client API.
- #265: [OpGroupDecorate](#) cannot target an [OpDecorationGroup](#).

## A.26 Changes from Version 1.2

- Moved version number to SPIR-V 1.3
- New functionality:
  - Added subgroup operations:
    - \* the [OpGroupNonUniform](#) instructions and [capabilities](#).
    - \* **Subgroup**-mask [built-in decorations](#).
  - Khronos SPIR-V issue #125, #138, #196: Removed capabilities from the [rounding modes](#).
  - Khronos SPIR-V issue #110: Removed the execution-model restrictions from [OpControlBarrier](#).
- Incorporated the following extensions:
  - SPV\_KHR\_shader\_draw\_parameters
  - SPV\_KHR\_16bit\_storage
  - SPV\_KHR\_device\_group
  - SPV\_KHR\_multiview
  - SPV\_KHR\_storage\_buffer\_storage\_class
  - SPV\_KHR\_variable\_pointers
- Reserved symbols for
  - SPV\_GOOGLE\_decorate\_string
  - SPV\_GOOGLE\_hlsl\_functionality1
  - SPV\_AMD\_gpu\_shader\_half\_float\_fetch
- Added [deprecation model](#).

## A.27 Changes from Version 1.3, Revision 1

- Fixed Issues:
  - Public SPIRV-Headers PR #73: Add missing fields for some NVIDIA-specific tokens.
  - Khronos SPIR-V Issue #202: [Shader Validation](#): Be clear that arrays of blocks set by the client API cannot have an **ArrayStride**.
  - Khronos SPIR-V Issue #210: Clarify the *Result Type* of [OpSampledImage](#).
  - Khronos SPIR-V Issue #211: State that [Derivative](#) instructions only work on 32-bit width components.
  - Khronos SPIR-V Issue #239: Clarify [OpImageFetch](#) is for an image whose *Sampled* operand is 1.
  - Khronos SPIR-V Issue #256: [OpAtomicCompareExchange](#) does not store if comparison fails.
  - Khronos SPIR-V Issue #269: Be more clear which bits are mutually exclusive for [memory semantics](#).
  - Khronos SPIR-V Issue #278: Delete [OpTypeRuntimeArray](#) restriction on storage classes, as this is already covered by the client API.
  - Khronos SPIR-V Issue #279:
    - \* Add section expository section 2.8.1 "Unsigned Versus Signed Integers".
    - \* As expected, [OpUConvert](#) can have vector *Result Type*.
  - Khronos SPIR-V Issue #280: [OpImageQuerySizeLod](#) and [OpImageQueryLevels](#) can be limited by the client API.
  - Khronos SPIR-V Issue #285: Remove **Kernel** as a [capability](#) implicitly declared by **Int8**.
  - Khronos SPIR-V Issue #290: Clarify implicit declaration of [capabilities](#), in part by changing the column heading to "Implicitly Declares".

- Khronos SPIR-V Issues #295: Explicitly say blocks cannot be nested in blocks, in the [validation](#) section. (This was already indirectly required.)
- Khronos SPIR-V Issue #299: Add the **ImageGatherExtended** capability to **ConstOffsets** in the [image operands section](#).
- Khronos SPIR-V Issues #303 and #304: [OpGroupNonUniformBallotBitExtract](#) documentation: add **Result Type** and fix **Index** parameter.
- Khronos SPIR-V Issue #310: Remove instruction word count from the [Limits](#) table, as it is already intrinsically limited.
- Khronos SPIR-V Issue #313: Move the **FPRoundingMode**-decoration validation rule to the [shader validation](#) section (not a universal rule). Also, include the **StorageBuffer** storage class in this rule.

## A.28 Changes from Version 1.3, Revision 2

- New enumerants:
  - For `SPV_KHR_8bit_storage`
- Fixed Issues:
  - Add definition of [Memory Object Declaration](#).
  - Khronos SPIR-V Issue #275: Clarify the meaning of **Aliased** and **Restrict** in the [Aliasing](#) section.
  - Khronos SPIR-V Issue #315: Be more specific about where many [decorations](#) are allowed, particularly for **OpFunctionParameter**. Includes being clear that the **BuiltIn** decoration does not apply to **OpFunctionParameter**.
  - Khronos SPIR-V Issue #348: Clarify [remainder](#) descriptions in [OpFRem](#), [OpFMod](#), [OpSRem](#), and [OpSMod](#).
  - Khronos SPIR-V Issue #342: State the **DepthReplacing** [execution-mode](#) behavior more specifically.
  - Khronos SPIR-V Issue #341: More specific wording for depth-hint [execution modes](#) **DepthGreater**, **DepthLess**, and **DepthUnchanged**.
  - Khronos SPIR-V Issues #276 and #311: Take more care with unreachable blocks in [structured control flow](#) and how to branch into a construct.
  - Khronos SPIR-V Issue #320: Include **OpExecutionModeId** in the [logical layout](#).
  - Khronos SPIR-V Issue #238: Fix description of [OpImageQuerySize](#) to correct *Sampled Type* → *Sampled* and list the correct set of dimensions.
  - Khronos SPIR-V Issue #346: Remove ordered rule for structures in the [memory layout](#): Vulkan allows out-of-order **Offset** layouts.
  - Khronos SPIR-V Issue #322: Allow [OpImageQuerySize](#) to query the size of a **NonReadable** image.
  - Khronos SPIR-V Issue #244: Be more clear about the connections between [dimensionalities](#) and capabilities, and in referring to them from [OpImageRead](#) and [OpImageWrite](#).
  - Khronos SPIR-V Issue #333: Be clear about overflow behavior for [OpIAdd](#), [OpISub](#), and [OpIMul](#).

## A.29 Changes from Version 1.3, Revision 3

- Add enumerants for
  - `SPV_KHR_vulkan_memory_model`
- Fixed Issues:
  - Typo: say [OpMatrixTimesVector](#) is **Matrix X Vector**.
  - Update on Khronos SPIR-V issue #244: Added **Shader** and **Kernel** capabilities to the **2D dimensionality**.
  - Khronos SPIR-V Issue #317: Clarify that the **Uniform** [decoration](#) should apply only to objects, and that the [dynamic instance](#) of the object is the same, rather than at the consumer usage.

- Khronos SPIR-V Issue #335: Clarify and correct [when it is valid](#) for pointers to be operands to **OpFunctionCall**. Corrections are believed to be consistent with existing front-end and back-end support.
- Khronos SPIR-V Issue #344: don't include inactive invocations in what makes the result of [OpGroupNonUniformBallotBitExtract](#) undefined.

### A.30 Changes from Version 1.3, Revision 4

- Add enumerants for
  - SPV\_NV\_fragment\_shader\_barycentric
  - SPV\_NV\_compute\_shader\_derivatives
  - SPV\_NV\_shader\_image\_footprint
  - SPV\_NV\_shading\_rate
  - SPV\_NV\_mesh\_shader
  - SPV\_NVX\_Raytracing
- Formatting: Removed **Enabling Extensions** column and instead list the extensions in the **Enabling Capabilities** column.

### A.31 Changes from Version 1.3, Revision 5

- Reserve Tokens for:
  - SPV\_KHR\_no\_integer\_wrap\_decoration
  - SPV\_KHR\_float\_controls
- Fixed Issues:
  - Khronos SPIR-V Issue #352: Remove from [OpFunction](#) the statement limiting the use its result. This does not result in any change in intent; it only avoids any past and potential future contradictions.
  - Khronos SPIR-V Issue #308: Don't allow runtime-sized arrays to be loaded or copied by [OpLoad](#) or [OpCopyMemory](#).
  - Include back-edge blocks in the list of blocks that can branch outside their own construct in the [structured control-flow rules](#).
  - Khronos OpenGL API issue #77: Clarify the **OriginUpperLeft** and **OriginLowerLeft** [execution modes](#) apply only to **FragCoord**.
  - State the **XfbStride** and **Stream** restrictions in the [Universal Validation Rules](#).
  - Khronos SPIR-V Issue #357: The *Memory Operands* of [OpCopyMemory](#) and [OpCopyMemorySized](#) applies to both *Source* and *Target*.
  - Khronos SPIR-V Issue #385: Be more clear what type *<id>* must be the same in [OpCopyMemory](#).
  - Khronos SPIR-V Issue #359: [OpAccessChain](#) and [OpPtrAccessChain](#) do indexing with signed indexes, and **OpPtrAccessChain** is allowed to compute addresses of elements one past the end of an array.
  - Khronos SPIR-V Issue #367: [General validation rules](#) allow the **Function** storage class for atomic access, while the [shader-specific validation rules](#) do not.
  - Khronos SPIR-V Issue #382: In [OpTypeFunction](#), disallow parameter types from being **OpTypeVoid**.
  - Khronos SPIR-V Issue #374: [Built-in](#) derocations can also apply to a constant instruction.
- Editorial:
  - Make it more clear in [OpVariable](#) what *Storage Classes* must be the same.
  - Remove references to specific APIs, and instead generally refer only to "client API"s. Note that the previous lists of APIs was nonnormative.
  - State the **FPRoundingMode** decoration rule more clearly in the section listing [Validation Rules for Shader Capabilities](#).
  - Don't say "value preserving" in the [Conversion](#) instructions. These now convert the "value numerically".
  - State variable-pointer [validation rules](#) more clearly.

## A.32 Changes from Version 1.3, Revision 6

- Reserve Tokens for:
  - SPV\_INTEL\_media\_block\_io
  - SPV\_NV\_cooperative\_matrix
  - SPV\_INTEL\_device\_side\_avc\_motion\_estimation, partially. See the SPV\_INTEL\_device\_side\_avc\_motion\_estimation extension specification for a full listing of tokens.
- Fixed Issues:
  - Khronos SPIR-V Issue #406: [Scope](#) values must come from the table of scope values.
  - Khronos SPIR-V Issue #419: [Validation rules](#) include **AtomicCounter** in the list of storage classes allowed for pointer operands to an **OpFunctionCall**.
  - Khronos SPIR-V Issue #325: [OpPhi](#) clarifications regarding parent dominance, in the instruction and the [validation rules](#), and forward references in the [Logical Layout section](#).
  - Khronos SPIR-V Issue #415: Remove the non-writable storage classes **PushConstant** and **Input** from the **FPRoundingMode** decoration [shader validation rule](#).
  - Khronos SPIR-V Issue #404: Clarify when [OpGroupNonUniformShuffleXor](#), [OpGroupNonUniformShuffleUp](#), and [OpGroupNonUniformShuffleDown](#) are valid or result in undefined values.
  - Khronos SPIR-V Issue #393: Be more clear that [OpConvertUToPtr](#) and [OpConvertPtrToU](#) operate only on unsigned scalar integers.
  - Khronos SPIR-V Issue #416: Result are undefined for all [Shift instructions](#) for shifts amounts equal to the bit width of the operand.
  - Khronos SPIR-V Issue #399: Refine the definition of a [variable pointer](#), particularly for function parameters receiving a variable pointer.
  - Khronos SPIR-V Issue #441: Clarify that [atomic instruction's Scope <id>](#) must be a valid memory scope. More generally, all *Scope <id>* operands are now either *Memory* or *Execution*.
  - Khronos SPIR-V Issue #426: Be more direct about undefined behavior for non-uniform control flow in [OpControlBarrier](#) and the [OpGroup...](#) instructions that discuss this.
- Deprecate
  - Khronos SPIR-V Issue #429: Deprecate [OpDecorationGroup](#), [OpGroupDecorate](#), and [OpGroupMemberDecorate](#)
- Editorial
  - Add more clarity that the full [client API describes the execution environment](#) (there is not a separate specification from the client API specification).

## A.33 Changes from Version 1.3, Revision 7

- Fixed Issues:
  - Khronos SPIR-V Issue #371: Restrict [intermediate object](#) types to variable types allowed at global scope. See [shader validation data rules](#).
  - Khronos SPIR-V Issue #408: (Re)allow the [decorations](#) **Volatile**, **Coherent**, **NonWritable**, and **NonReadable** on members of blocks. (Temporarily dropping this functionality was accidental/clerical; intent is that it has always been present.)
  - Khronos SPIR-V Issue #418: Add statements about undefinedness and how NaNs are mixed to [OpGroupNonUniformFAdd](#), [OpGroupNonUniformFMul](#), [OpGroupNonUniformFMin](#), and [OpGroupNonUniformFMax](#).

- Khronos SPIR-V Issue #435: Expand the [universal validation](#) rule for variable pointers and matrices to also disallow pointing within a matrix.
- Khronos SPIR-V Issue #447: Remove implication that [OpPtrAccessChain](#) obeys an **ArrayStride** decoration in storage classes laid out by the implementation.
- Khronos SPIR-V Issue #450: Allow pointers to **OpFunctionCall** to be pointers to an element of an array of samplers or images. See the [universal validation rules](#) under the **Logical** addressing model without variable pointers.
- Khronos SPIR-V Issue #452: [OpGroupNonUniformAllEqual](#) uses ordered compares for floating-point values.
- Khronos SPIR-V Issue #454: Add **OpExecutionModeId** to the list of allowed forward references in the [Logical Layout of a Module](#).

## A.34 Changes from Version 1.3

- New Functionality:
  - Public issue #35: [OpEntryPoint](#) must list all global variables in the interface. Additionally, duplication in the list is not allowed.
  - Khronos SPIR-V Issue #140: Generalize [OpSelect](#) to select between two objects.
  - Khronos SPIR-V Issue #156: Add **OpUConvert** to the list of required opcodes in [OpSpecConstantOp](#).
  - Khronos SPIR-V Issue #345: Generalize the [NonWritable decoration](#) to include **Private** and **Function** storage classes. This helps identify lookup tables.
  - Khronos SPIR-V Issue #84: Add [OpCopyLogical](#) to copy similar but unequal types.
  - Khronos SPIR-V Issue #170: Add [OpPtrEqual](#) and [OpPtrNotEqual](#) to compare pointers.
  - Khronos SPIR-V Issue #362: Add [OpPtrDiff](#) to count the number of elements between two element pointers.
  - Khronos SPIR-V Issue #332: Add **SignExtend** and **ZeroExtend** [image operands](#).
  - Khronos SPIR-V Issue #340: Add the [UniformId decoration](#), which takes a *Scope* operand.
  - Khronos SPIR-V Issue #112: Add iteration-control [loop controls](#).
  - Khronos SPIR-V Issue #366: Change *Memory Access* operands and the **Memory Access** section to now be *Memory Operands* and the [Memory Operands](#) section.
  - Khronos SPIR-V Issue #357: Allow [OpCopyMemory](#) and [OpCopyMemorySized](#) to have [Memory Operands](#) for both their *Source* and *Target*.
- New Extensions Incorporated into SPIR-V 1.4:
  - SPV\_KHR\_no\_integer\_wrap\_decoration. See **NoSignedWrap** and **NoUnsignedWrap** [decorations](#) and [universal validation](#) decoration rules.
  - SPV\_GOOGLE\_decorate\_string. See [OpDecorateString](#) and [OpMemberDecorateString](#).
  - SPV\_GOOGLE\_hlsl\_functionality1. See **CounterBuffer** and **UserSemantic** [decorations](#).
  - SPV\_KHR\_float\_controls. See **DenormPreserve**, **DenormFlushToZero**, **SignedZeroInfNanPreserve**, **RoundingModeRTE**, and **RoundingModeRTZ** [execution modes](#) and [capabilities](#).
- Removed:
  - Khronos SPIR-V Issue #437: Removed [OpAtomicCompareExchangeWeak](#), and the **BufferBlock** [decoration](#).

## A.35 Changes from Version 1.4, Revision 1

- GitHub SPIRV-Registry Issue #25: Remove validation rule for simultaneous use of **RowMajor** and **ColMajor**, instead stating this in the [decoration](#) cells themselves.
- Khronos Issue #319: Bring in fixes to the SPV\_KHR\_16bit\_storage extension. See the **StorageBuffer16BitAccess** and the related 16-bit [capabilities](#).

- Khronos Issue #363: [OpTypeBool](#) can be used in the Input and Output storage classes, but the client APIs still only allow built-in Boolean variables (e.g. `FrontFacing`), not user variables.
- Khronos Issue #432: Remove the untrue expository statement "**OpFunction** is the only valid use of [OpTypeFunction](#)."
- Khronos Issue #465: Distinguish between the **Groups capability** and the [Group and Subgroup instructions](#).
- Khronos Issue #484: Have [OpTypeArray](#) and [OpTypeStruct](#) point to their definitions.
- Khronos Issue #477: Include 0.0 in the range of required values for **RelaxedPrecision** and other minor clarifications in [the relaxed-precision section](#) regarding floating-point precision.
- Khronos Issue #226: Be more clear about explicit level-of-detail being either **Lod** or **Grad** throughout the sampling instructions, and that **ConstOffset**, **Offset**, and **ConstOffsets** are mutually exclusive in [the image operand's descriptions](#).
- Khronos Issue #390: The **Volatile decoration** does not guarantee each invocation performs the access.
- Reserved New Tokens for:
  - `SPV_EXT_fragment_shader_interlock`
  - `SPV_NV_shader_sm_builtins`
  - `SPV_INTEL_shader_integer_functions2`
  - `SPV_EXT_demote_to_helper_invocation`
  - `SPV_KHR_shader_clock`
  - `SPV_GOOGLE_user_type`
  - **Volatile**, for `SPV_KHR_vulkan_memory_model`

### A.36 Changes from Version 1.4

- Extensions Incorporated into SPIR-V 1.5:
  - `SPV_KHR_8bit_storage`
  - `SPV_EXT_descriptor_indexing`
  - `SPV_EXT_shader_viewport_index_layer`, with changes: Replaced the single **ShaderViewportIndexLayerEXT** capability with the two new [capabilities](#) **ShaderViewportIndex** and **ShaderLayer**. Declaring both is equivalent to declaring **ShaderViewportIndexLayerEXT**.
  - `SPV_EXT_physical_storage_buffer` and `SPV_KHR_physical_storage_buffer`
  - `SPV_KHR_vulkan_memory_model`
- Khronos Issue #402: Relax [OpGroupNonUniformBroadcast](#) *Id* from constant to dynamically uniform, starting with version 1.5.
- Khronos Issue #493: Relax [OpGroupNonUniformQuadBroadcast](#) *Id* from constant to dynamically uniform, starting with version 1.5.
- Khronos Issue #494: Update the [Dynamically Uniform](#) definition to say that the invocation group is the set of invocations, *unless otherwise stated*.
- Khronos Issue #485: When [RelaxedPrecision](#) is applied to a numerical instruction, the operands may be truncated.

### A.37 Changes from Version 1.5, Revision 1

- Khronos Issue #511: Allow non-execution non-memory scopes in the introduction to the [Scope <id> section](#).
- Khronos MR 1147: Fix [OpFNegate](#) so it handles 0.0f properly
- Khronos Issue #502: [OpAccessChain](#) array indexes must be in-bounds for logical pointer types.
- Khronos Issue #518: Include both **VariablePointers** and **VariablePointersStorageBuffer** capabilities in the [validation](#) rules when discussing variable pointer rules.

- Khronos Issue #496: Allow **Invariant** to [decorate](#) a block member.
- Khronos Issue #469: Disallow **OpConstantNull** result and **OpPtrEqual**, **OpPtrNotEqual**, and **OpPtrDiff** operands from being pointers into the **PhysicalStorageBuffer** storage class. See the [PhysicalStorageBuffer validation rules](#).
- Khronos Issue #425: Clarify what variables can allocate pointers, in the [validation rules](#), based on the declarations of the **VariablePointers** or **VariablePointersStorageBuffer** capabilities.
- Khronos Issue #442: Add a note pointing out where [signedness](#) has some semantic meaning.
- Khronos Issue #498: Relaxed the set of allowed types for some [Group and Subgroup instructions](#).
- Khronos Issue #500: Deprecate [OpLessOrGreater](#) in favor of [OpFOrdNotEqual](#).
- Khronos Issue #354: Rationalize [literals](#) throughout the specification. Remove "immediate" as a separate definition. Be more rigid about a single literal mapping to one or more operands, and that the instruction description defines the type of the literal.
- Khronos Issue #479: Disallow intermediate aggregate types that could not be used to declare global variables, and disallow all types that can't be used for declaring variables. See the [shader validation](#) "Type Rules". Also, more strongly state that intermediate values don't form a storage class, in the introduction to [storage classes](#).
- Khronos Issue #78: Use a more correct definition of [back edge](#).
- Khronos Issue #492: Overflow with [OpSDiv](#), [OpSRem](#), and [OpSMod](#) results in undefined behavior.
